excerpt from diagnosis and treatment of diseases of the liver a brief tabulation of the functions of the liver will undoubtedly impress the reader with the great physiologic importance of the liver the largest organ of the body and it will also show the enormous working field for physiologists pathologists and clinicians namely the recognition of the functional derangements of the liver as well as the diseases resulting directly from the alteration in structure of the hepatic cells and lastly many gastro intestinal diseases the functions ascribed to the liver are 1 the formation of bile bile is principally concerned in the digestion of fat 2 glycogenic function the conversion of carbohydrates into glycogen and the reconversion of glycogen into sugar 3 the conversion of amino bodies formed during the process of digestion into urea 4 antitoxic or protective function which is commonly referred to as the detoxifying action of the liver the proper functions of the liver are dependent upon the integrity of the liver cells when for any reason the hepatic cells become morphologically altered we must expect serious interference in the health of the individual directly in proportion to the degree of damage to the cells in question either one or more of the functions may be affected while there are many primary diseases of the liver we have a goodly number resulting from changes elsewhere in the body about the publisher forgotten books publishes hundreds of thousands of rare and classic

Pathophysiology of the Liver 1988

the surgical resection of a major portion of the liver for cancer of this viscus has long been neglected although the first successful resection of a primary malignant tumor of the liver was performed by lucke in 1891 this pioneer effort failed to stimulate interest in the operative removal of hepatic neoplasms earlier surgeons were intimidated by the concept of the liver as a huge vascular sponge possessed of three intricate circulatory systems to the fear of uncontrollable hemorrhage was added the supposed hazard of hepatic insufficiency following the removal of a large portion of an organ with so many vital functions last but not least was the difficulty in surgical exposure only in recent years has the sporadic interest of surgeons been changed to a growing concern about

the possibilities of extirpation of hepatic tumors by the performance of major hepatic lobectomies four factors have contributed to this 1 the dissemination of more accurate information about the surgical anatomy of the intrinsic and extrinsic hepatic circulatory systems which has acquainted surgeons with the principles and techniques of hemostasis essential for successful operative intervention on the liver 2 increased knowledge of the functions and regenerative capacity of the liver 3 greater diagnostic skill aided by modern laboratory procedures 4 improved surgical exposure of the liver by the use of laparothoracotomy incisions primary liver cancer varies widely in incidence in different parts of the world

excerpt from a clinical treatise on diseases of the liver vol 2 of 3 scientific medicine had scarcely removed this traditional remnant of a hippocratic humoral pathology when it became necessary from an unprejudiced observation of facts to relapse into the old doctrine diseases became known in which black matter produced by decomposition of the blood became developed in the spleen which black matter passed into the portal vein and at one time obstructed the hepatic vessels at another passed through these and entering the general circulation filled up the

capillaries of the brain and other organs morbid processes in fact which gave rise to symptoms similar to those which were described by the ancients about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

leading authorities from the foremost transplant centers have compiled a comprehensive text on the art and science of liver transplantation this edition contains updated information in histopathology immunosuppressive therapy and infectious problems for the transplant patient the text also describes and puts into perspective the many innovative and important advances in liver transplantation that have emerged over the past decade

CLINICAL TREATISE ON DISEASES OF THE LIVER,. 2018

primary liver cancer is a rather unusual malignancy in that the incidence varies tremendously from one geographical area to another while relatively uncommon in western countries it is the most prevalent malignant neoplasm in southeast asia south africa and many other regions in all the countries in which primary liver cancer is very prevalent account for more than two thirds of the world s population in china alone approximately 100 000 people die every year from primary liver cancer mostly hepatocellular carcinoma the incidence is rising in some countries especially japan where it has doubled among males in the past 15 years or so a staggering and puzzling trend since the demonstration of an etiological relationship between hepatitis b virus infection and hepatocellular carcinoma intensive research has been conducted in an effort to elucidate the role of the virus in hepatocarcinogenesis though much progress has been made a full understanding of the molecular events leading to malignant transformation of the hepatocyte will probably require many more years of rigorous investigation chemical carcinogens and several industrial pollutants may also be involved in the etiopathogenesis of neoplastic liver disease

Diseases of the Liver and Biliary System 1968

due to the latest developments in magnetic resonance imaging for the evaluation of liver pathology a second completely revised and enlarged edition of this book was felt necessary despite only three years having elapsed since the first edition all chapters from the first edition have been revised and enriched with additional illustrations and information new chapters have been added covering important and highly relevant topics among which imaging of pseudolesions imaging of neoplastic diseases in pediatric subjects imaging of bile ducts mr angiography and imaging pre and post liver transplantation particular attention has been paid to the differential use of contrast agents with emphasis placed on the authors broad experience of mr imaging of focal liver lesions using different contrast agents the diverse mechanisms of action of all mr contrast agents applicable for liver imaging are explained in detail and comparative examples are provided as was the case with the first edition this book will prove invaluable to radiologists wishing to further expand or consolidate their routine approach to mr imaging of the liver
