reliability analysis and asset management of engineering systems explains methods that can be used to evaluate reliability and availability of complex systems including simulation based methods the increasing digitization of mechanical processes driven by industry 4 0 increases the interaction between machines and monitoring and control systems leading to increases in system complexity for those systems the reliability and availability analyses are increasingly challenging as the interaction between machines has become more

complex and the analysis of the flexibility of the production systems to respond to machinery failure may require advanced simulation techniques this book fills a gap on how to deal with such complex systems by linking the concepts of systems reliability and asset management and then making these solutions more accessible to industry by explaining the availability analysis of complex systems based on simulation methods that emphasise petri nets explains how to use a monitoring database to perform important tasks including an update of complex systems reliability shows how to diagnose probable machinery based causes of system performance degradation by using a monitoring database and reliability estimates in an integrated way describes practical techniques for the application of ai and machine learning methods to fault detection and diagnosis problems

drainage infrastructure systems culvert storm sewer outfall and related drainage elements are mostly buried underground and are in need of special attention in terms of proactive preventive asset management strategy drainage infrastructure systems represent an integral portion of roadway assets that routinely require inspection maintenance repair and renewal further challenges

are the wide geospatial distribution of these infrastructure assets and environmental exposure there has been considerable research conducted on culverts but mostly looked at the problem from a traditional structural geotechnical perspective asset management procedures for culverts and drainage infrastructure systems are complex issues and can benefit a great deal from an optimal asset management program that draws from programs pertaining to buried pipes the first and most important step in an asset management initiative is the establishment of mechanism for asset inventory and asset conditions in a format compatible with the routine procedures of field operators and inspectors the first objective of this research project was to develop field protocols and operational business rules for inventory data collection and management and inspection of drainage infrastructures in terms of types of data to be collected frequency of inspection and analysis and reporting mechanisms after review of these protocols by the project oversight committee a pilot study was conducted to verify efficiency of their implementation the condition assessment protocol introduced is useful in evaluating the overall condition of culverts and can be used for decision making regarding the repair renewal or replacement of culverts for the second objective of this project investigators examined the inventory and inspection protocols employed by ohio department of transportation odot and developed a decision support platform which establishes a link between the inspection results and appropriate repair renewal and replacement procedures after applying the recommended procedures the transportation agencies can better track the conditions of culverts thereby reducing the risks of culvert failures
