Maine Water Distribution Operator Certification Exam Unofficial Self Practice Exercise Questions 2018-08-07 this study investigates the patterns that describe reliability of water distribution networks focusing to the node connectivity energy balance and economics of construction operation and maintenance a number of measures to evaluate the network resilience has been developed and assessed to arrive at more accurate diagnostics of regular and irregular demand scenarios these measures have been proposed as a part of the methodology for snap shot assessment of network reliability based on its configuration and hydraulic performance practical outcome of the research is the decision support tool for reliability based design of water distribution networks this computer package named nedra network design and reliability assessment consists of the modules for network generation filtering initialisation optimisation diagnostics and cost calculation which can be used for sensitivity analyses of single network layout or assessments of multiple layouts the study concludes that none of the analysed aspects develops clear singular patterns nevertheless the proposed network buffer index nbi and the hydraulic reliability diagram hrd as visual representation of the network resilience give sufficient snap shot pointing the composition of the index value and displaying possible weak points in the network that can be hidden behind the averaged values of

various reliability measures

Water Distribution System Handbook 2000 water utilities worldwide lose 128 billion cubic meters annually causing annual monetary losses estimated at usd 40 billion most of these losses occur in developing countries 74 this calls for rethinking the challenges facing water utilities in developing countries foremost of which is the assessment of water losses in intermittent supply networks water loss assessment methods were originally developed in continuous supply systems and their application in intermittently operated networks in developing countries is hindered by the widespread use of household water tanks and unauthorised consumption this study provides an extensive review of existing methods and software tools for water loss assessment in addition several new methods were developed which offer improved water loss assessment in intermittent supply as the volume of water loss varies monthly and annually according to the amount of supplied water this study proposes procedures to normalise the volume of water loss in order to enable water utilities to monitor and benchmark their performance on water loss management the study also developed a novel method of estimating apparent losses using routine data of wwtp inflows enabling future real time monitoring of losses in networks different methods have also been suggested to estimate the unauthorised consumption in networks this study found that minimum night flow analysis can still be applied in intermittent supply if an area of the network is supplied for several days furthermore this study concluded that water meter performance is enhanced in intermittent supply conditions however continuous supply in the presence of float valves significantly reduces the accuracy of water meters finally this study provides guidance and highlights several knowledge gaps in order to improve the accuracy of water loss assessment in intermittent supply accurate assessment of water loss is a prerequisite for reliable leakage modelling and minimisation as well as planning for and monitoring of water loss management in distribution networks
