since 2008 the global center of excellence coe at kyoto university japan has been engaged in a program called energy science in the age of global warming toward a co2 zero emission energy system its aim is to establish an international education and research platform to foster educators researchers and policy makers who can develop technologies and propose policies for establishing a co2 zero emission society no longer dependent on fossil fuels it is well known that the energy problem cannot simply be labeled a technological one as it is also deeply involved with social and economic issues the establishment of a low carbon energy science as an interdisciplinary field integrating social sciences with natural sciences is necessary the global coe is setting out a zero emission technology roadmap and is promoting socioeconomic studies of energy studies of new technologies for renewable energies and research for advanced nuclear energy it has also established the global coe unit for energy science education to support young researchers as they apply their skills and knowledge and a broad international perspective to respond to issues of energy and the environment in our societies comprising the proceedings of the third international symposium of the global coe program this book follows on the earlier volumes zero carbon energy kyoto 2009 and 2010 published in march 2010 and february 2011 respectively

this thesis presents five studies of a gas shale reservoir using diverse methodologies to investigate geomechanical and transport properties that are important across the full reservoir lifecycle using the barnett shale as a case study we investigated adsorption permeability geomechanics microseismicity and stress evolution in two different study areas the main goals of this thesis can be divided into two parts first to investigate how flow properties evolve with changes in stress and gas species and second to understand how the interactions between stress fractures and microseismicity control the creation of a permeable reservoir volume during hydraulic fracturing in chapter 2 we present results from adsorption and permeability experiments conducted on barnett shale rock samples we found langmuir type adsorption of ch₄ and n₂ at magnitudes consistent with previous studies of the barnett shale three of our samples demonstrated bet type adsorption of co₂ in contrast to all previous studies on co₂ adsorption in gas shales which found langmuir adsorption at low pressures 600 psi we found preferential adsorption of co₂ over ch₄ ranging from 3 6x to 5 5x while our measurements were conducted at low pressures up to 1500 psi when our model fits are extrapolated to reservoir pressures they reach similar adsorption magnitudes as have been found in previous studies at these high reservoir pressures the very large preferential adsorption of co₂ over ch₄ up to 5 10x suggests a significant potential for co₂ storage in gas shales like the barnett if practical problems of injectivity and matrix transport can be overcome we successfully measured permeability versus effective stress on two intact barnett shale samples we measured permeability effective stress coefficients less than 1 on both samples invalidating our hypothesis that there

might be throughgoing flow paths within the soft porous organic kerogen that would lead the permeability effective stress coefficient to be greater than 1 the results suggest that microcracks are likely the dominant flow paths at these scales in chapter 3 we present integrated geological geophysical and geomechanical data in order to characterize the rock properties in our barnett shale study area and to model the stress state in the reservoir before hydraulic fracturing occurred five parallel horizontal wells were drilled in the study area and then fractured using three different techniques we used the well logs from a vertical pilot well and a horizontal well to constrain the stress state in the reservoir while there was some variation along the length of the well we were able to determine a best fit stress state of $p_p = 0.48 \text{ psi ft}$ $\sigma_1 = 1.1 \text{ psi ft}$ $\sigma_{\text{max}} = 0.73 \text{ psi ft}$ and $\sigma_{\text{min}} = 0.68 \text{ psi ft}$ applying this stress state to the mapped natural fractures indicates that there is significant potential for induced shear slip on natural fracture planes in this region of the barnett particularly close to the main hydraulic fracture where the pore pressure increase during hydraulic fracturing is likely to be very high in chapter 4 we present new techniques to quantify the robustness of hydraulic fracturing in gas shale reservoirs the case study we analyzed involves five parallel horizontal wells in the barnett shale with 51 frac stages to investigate the numbers sizes and types of microearthquakes initiated during each frac stage we created gutenbergrichter type magnitude distribution plots to see if the size of events follows the characteristic scaling relationship found in natural earthquakes we found that slickwater fracturing does generate a log linear distribution of microearthquakes but that it creates proportionally more small events than natural earthquake sources finding considerable variability in the generation of microearthquakes we used the magnitude analysis as a

proxy for the robustness of the stimulation of a given stage we found that the conventionally fractured well and the two alternately fractured wells zipperfracs were more effective than the simultaneously fractured wells simulfracs in generating microearthquakes we also found that the later stages of fracturing a given well were more successful in generating microearthquakes than the early stages in chapter 5 we present estimates of stress evolution in our study reservoir through analysis of the instantaneous shut in pressure isip at the end of each stage the isip increased stage by stage for all wells but the simulfrac wells showed the greatest increase and the zipperfrac wells the least we modeled the stress increase in the reservoir with a simple sequence of 2 d cracks along the length of the well when using a spacing of one crack per stage the modeled stress increase was nearly identical to the measured stress increase in the zipperfrac wells when using three cracks per stage the modeled final stage stress magnitude matched the measured final stage stress magnitude from the simulfrac wells but the rate of stress increase in the simulfrac wells was much more gradual than the model predicted to further investigate the causes of these isip trends we began numerical flow and stress analysis to more realistically model the processes in the reservoir one of our hypotheses was that the shorter total time needed to complete all the stages of the simulfrac wells was the cause of the greater isip increase compared to the zipperfrac wells the microseismic activity level measured in chapter 4 also correlates with total length of injection suggesting leak off into the reservoir encouraged shear failure numerical modeling using the coupled fem and flow software geosim was able to model some cumulative stress increase the reservoir but the full trend was not replicated further work to model field observations of hydraulic fracturing will enhance our understanding of the impact that hydraulic fracturing and stress

change have on fracture creation and permeability enhancement in gas shales

since the 1990s baltic russian relations have been amongst the most contentious on the european continent energy security concerns historical legacies and the status of russian minorities have all proved key flash points baltic russian relations have been described as a litmus test of russia s willingness to leave behind its imperialist ambitions simultaneously the policies of tallinn riga or vilnius towards russia can have a direct impact on eu russian and nato russian relations the baltic states share similar histories and resources and face the same geopolitical challenges all are dependent on russia for energy yet as this fascinating study reveals they have pursued very different foreign policies towards their powerful neighbour in the politics of energy and memory between the baltic states and russia agnia grigas provides an unprecedented analysis of contemporary baltic russian relations and identifies the causal factors that drive the foreign policies of the baltic states in such divergent routes supported by case studies on the oil and gas sectors as well as the tug of history this book is an invaluable resource for scholars and policy makers
