the classical exponential polynomials today commonly named after e t bell have a wide range of remarkable applications in combinatorics algebra analysis and mathematical physics within the algebraic framework presented in this book they appear as structural coefficients in finite expansions of certain higher order derivative operators in this way a correspondence between polynomials and functions is established which leads via compositional inversion to the specification and the effective computation of orthogonal companions of the bell polynomials together with the latter one obtains the larger class of multivariate stirling polynomials their fundamental recurrences and inverse relations are examined in detail and shown to be directly related to corresponding identities for the stirling numbers the following topics are also covered polynomial families that can be represented by bell polynomials inversion formulas in particular of schlömilch schläfli type applications to binomial sequences new aspects of the lagrange inversion and as a highlight reciprocity laws which unite a polynomial family and that of orthogonal companions besides a mathematica r package and an extensive bibliography additional material is compiled in a number of notes and supplements
