a wide ranging exploration of how music has influenced science through the ages from fifteenth century cosmology to twentieth century string theory in the natural science of ancient greece music formed the meeting place between numbers and perception for the next two millennia pesic tells us in music and the making of modern science liberal education connected music with arithmetic geometry and astronomy within a fourfold study the quadrivium peter pesic argues provocatively that music has had a formative effect on the development of modern science that music has been not just a charming accompaniment to thought but a conceptual force in its own right pesic explores a series of episodes in which music influenced science moments in which prior developments in music arguably affected subsequent aspects of natural science he describes encounters between harmony and fifteenth century

cosmological controversies between musical initiatives and irrational numbers between vibrating bodies and the emergent electromagnetism he offers lively accounts of how newton applied the musical scale to define the colors in the spectrum how euler and others applied musical ideas to develop the wave theory of light and how a harmonium prepared max planck to find a quantum theory that reengaged the mathematics of vibration taken together these cases document the peculiar power of music its autonomous force as a stream of experience capable of stimulating insights different from those mediated by the verbal and the visual an innovative e book edition available for ios devices will allow sound examples to be played by a touch and shows the score in a moving line

for many years i have been interested in global analysis of nonlinear systems the original interest stemmed from the study of snap through stability and jump phenomena in structures for systems of this kind where there exist multiple stable equilibrium states or periodic motions it is important to examine the domains of attraction of these responses in the state space it was through work in this direction that the cell to cell mapping methods were introduced these methods have received considerable development in the last few years and have also been applied to some concrete problems the results look very encouraging and promising however up to now the effort of developing these methods has been by a very small number of people there was therefore a suggestion that the published material scattered now in various journal articles could perhaps be pulled together into book form thus making it more readily available to the general audience in the field of nonlinear oscillations and nonlinear dynamical systems conceivably this might facilitate getting more people interested in working on this topic on the other hand there is always a question as to whether a topic a holds enough promise for the future and b has gained enough maturity to be put into book form with regard to a only the future will tell with regard to b i believe that from the point of view of both foundation and methodology the methods are far from mature
