biomedical engineering modeling of pancreatic respiratory and renal regulatory systems and their medical assessments addresses the need for biomedical engineering to provide physiological analysis of organ systems and their medical applications to help enable quantitative formulation of physiological systems and defining their functions and dysfunctions leading to precision diagnostics of diabetes lung diseases and kidney failure often in the form of non dimensional indices the book chapters also deal with treatment systems namely automated insulin infusion systems hemodialysis and peritoneal dialysis the book is formulated to solve many physiological bioengineering and medical problems covers foundational concepts of the emerging fields of quantitative physiology and computational medicine developing the biomedical engineering modeling of three important organ systems pancreas lungs and kidneys provides readers with detailed understanding of novel biomedical engineering strategies in key areas such as pancreatic system engineering glucose insulin regulatory system engineering pulmonary system engineering and renal system engineering provides in depth technical coverage of computational modeling techniques and applied mathematics for these important physiological systems including differential equations and the associated matlab datasets for all applied diagnostic and treatment examples
