in june 1987 neurobiologists immunologists molecular biologists virologists and neurologists from several countries met in vancouver to discuss recent advances of relevance to multiple sclerosis the symposium was a part of the 22nd canadian congress of neurological sciences meeting and was sponsored by funds from the multiple sclerosis society of canada and the medical research council of canada the presentations covered five major topics basic neurobiology molecular biology the role of viruses in demyelination immune function and dysfunction in multiple sclerosis and clinical magnetic resonance imaging studies it was heartening to note that scientists from several different disciplines were working towards a common end point the understanding and treatment of multiple sclerosis in this book speakers at the symposium have each presented a chapter of their findings and discussions in addition some non participants at the symposium have been invited to submit chapters in order to give this volume a more complete scope it is hoped that the reader will find this book a useful reference for several subjects of interest to multiple sclerosis in closing i would like to thank the following for their help and support the multiple sclerosis society of canada and the medical research council of canada for their financial support the contributors of this book for their manuscripts dr a eisen mrs k eisen mrs p bodnarchuk and mrs m kim for their efforts in planning and organizing the symposium and ms catherine schikowski for her secretarial assistance seung u kim m d ph d

a satellite symposium entitled myelination and demyelination recent chemical advances was held in helsinki from august 29 to 31 1977 after the sixth international meeting of the international society for neurochemistry in copenhagen myelin is a nervous tissue structure that is most suitable as a subject of biochemical investigation it is easy to isolate in a highly purified form is rather stable even after death and is affected by a variety of neurological and other diseases its lesions are particularly important in the study of multiple sclerosis a disease which is relatively prevalent in finland and has therefore been of interest to a great many finnish scientists the first half of this book is concerned with the biochemical composition and molecular organization of myelin the second half with the experimental and clinical aspects of demyelination the comments given after each of the presentations at the symposium were not recorded as such but each author was requested to modify his or her paper accordingly the editing and publication of this book would not have been possible without the excellent efforts and co operation of my wife mrs l m palo acting as general secretary and later as editorial secretary of the symposium as organizing committee chairman i would also like to thank the members of the committee dr m haltia dr e kivalo dr t kosunen dr m panelius and especially dr

immunization to protect infants and children from vaccine preventable diseases is one of the greatest achievements of public health immunization is not without risks however it is well established for example that the oral polio vaccine can on rare occasion cause paralytic polio the immunization safety review committee was established by the institute of medicine iom to evaluate

the available evidence on a series of immunization safety concerns the committee is charged with examining three immunization safety hypotheses each year during the three year study period 2001 2003 while all of the committee members share the view that immunization is generally beneficial none of them has a vested interest in the specific immunization safety issues that come before the group in this report which is the fourth in the series the committee examines the hypothesis that the hepatitis b vaccine increases the risk for demyelinating disorders of the central or peripheral nervous systems including multiple sclerosis ms and guillain barré syndrome gbs

this latest edition to the contemporary neurology series will fill one of the few remaining neurologic gaps within the series multiple sclerosis written solely by moises rodriguez orhun kantarci and istvan pirko of the mayo clinic in rochester mn will offer proven effective treatments for specific presentations and symptoms of multiple sclerosis along with a pathophysiological explanation of why they work it bridges a needed gap between overly simplistic therapy manuals and basic science texts that discuss human disease only insofar as it mimics what is observed in animal models of the disease in the laboratory additionally it seeks to offer an efficient integrative approach to symptomatic treatment to avoid over medication and side effects it discusses the heterogeneous causes of the disease and the need to develop individualized treatments that address the basic pathophysiologic processes that characterize each patient s disease with the future goal of individualized medicine multiple sclerosis covers both the basic research aspects of ms epidemiology neuropathology genetics and immunology as well as the treatment options associated with the ms patient sleep steroids pharma neuropsychology and growth factors to name a few multiple sclerosis will focus on the medical treatment drug treatment of ms rather than on physical medicine and rehabilitation not the author s strength the authors will also make ample use of flow diagrams bulleted points and tables to help the reader better understand ms and its etiology and treatment

the diseases that fall under the generalized group of demyelinating diseases multiple sclerosis leukodystrophies encephalomyelitis are the focus of worldwide concern this volume contains papers presented by leading scientists who attended the nato advanced research workshop held at the istituto superiore di sanita rome march 1 4 1993 this book is an update of the previous one published in 1987 of the research discussed at a similar meeting held in 1986 it was decided to hold this 2nd meeting since there has been great progress in the advances in understanding the myelinogenesis process in the last five years

the workshop gathered together scientists from many fields such as cellular and molecular biology immunology pathology virology and of course clinical neurology stimulating ideas were exchanged in the hope that more knowledge of demyelinating diseases can lead to new therapeutic approaches although the workshop was on the whole similar to the previous one this time there was more emphasis on experimental models and clinical aspects in the former the use of animal and cellular models as tools for understanding the pathological mechanisms linked to human disease were discussed in the latter the clinicians described the filtering down of basic research to clinical treatment the publication of this interdisciplinary exchange is to make known the results of the most recent research among the investigators from all over the world involved in these studies
