the aim of the present book will be to provide a comprehensive account of our present knowledge of the theory of dynamical phenomena exhibited by close binary systems and on the basis of such phenomena as have been

attested by available observations to outline probable evolutionary trends of such systems in the course of time the evolution of the stars motivated by nuclear as well as gravitational energy sources constitutes nowadays a well established branch of stellar astronomy no theories of such an evolution are as yet sufficiently specific let alone infallible not to require continual tests by a confrontation of their consequences with the observed properties of actual stars at different stages of their evolution the discriminating power of such tests depends of course on the range of information offered by the test objects single stars which move alone in space are now known to represent only a minority of objects constituting our galaxy cf chapter 1 2 and are moreover not very revealing of their basic physical characteristics such as their masses or absolute dimensions if there were no binary systems in the sky the only star whose vital statistics would be fully known to us would be our sun
