vacuum systems are in wide spread use in the petrochemical plants petroleum refineries and power generation plants the existing texts on this subject are theoretical in nature and only deal with how the equipment functions when in good mechanical conditions from the viewpoint of the equipment vendor also the existing texts fail to consider the interaction of the vacuum system with the process equipment it serves and the variability of the motive steam conditions change in cooling water temperature condenser fouling and erosion of the ejectors here are some of the many questions answered in this groundbreaking volume why does my first stage jet make a surging sound during hot weather why does the vacuum suddenly break i ve seen moisture condensing on the jet s body what s causing that why do i have to steam out the drain legs from our condensers superheated steam is making our vacuum worse is this normal how can i locate and measure air leaks reducing the steam pressure to my jets improves vacuum but why i can t pull the pre condenser bundle the shell side is fouling what should i do we re not getting our normal horsepower from our steam turbine could this be a jet problem raising the seal drum level improves vacuum is there an explanation for this our turbine exhaust steam pressure to our surface condenser has doubled in the last two years what should we do restricting cooling water flow from our elevated condensers improves vacuum is this possible what s a converging diverging ejector all about what s the difference between a barometric condenser and a surface condenser which is better

roll to roll vacuum deposition is the technology that applies an even coating to a flexible material that can be held on a roll and provides a much faster and cheaper method of bulk coating than deposition onto single pieces or non flexible surfaces such as glass this technology has been used in industrial scale applications for some time including a wide range of metalized packaging e g snack packets its potential as a high speed scalable process has seen an increasing range of new products emerging that employ this cost effective technology solar energy products are moving from rigid panels onto flexible substrates which are cheaper and more versatile in a similar way electronic circuit boards can be produced on a flexible polymer creating a new range of flexible electronics products flexible displays are another area of new technology in vacuum coating with flexible display panels and light sources emerging charles bishop has written this book to meet the need he identified as a trainer and consultant to the vacuum coatings industry for a non mathematical guide to the technologies equipment processes and applications of vacuum deposition his book is aimed at a wide audience of engineers technicians and production management it also provides a guide to the subject for sectors in which vacuum deposition is a novel technology such as solar energy and flexible electronics bishop s non mathematical explanation of vacuum deposition technologies will empower a wide range of technicians production managers and engineers in related disciplines to improve performance and maximize productivity from vacuum coating systems provides the knowledge and understanding needed to specify systems more effectively and enhance the dialogue between non specialists and suppliers engineers provides those in the rapidly expanding fields of solar energy display panels and flexible electronics with the know how to unlock the potential of vacuum coating to transform their processes and products
