molecular pathology the molecular basis of human disease provides a current and comprehensive view of the molecular basis and mechanisms of human disease combining accepted principles with broader theoretical concepts and with contributions from a group of experts the book looks into disease processes in the context of traditional pathology and their implications for translational molecular medicine it also discusses concepts in molecular biology and genetics recent scientific and technological advances in modern pathology the concept of molecular pathogenesis of disease and how disease evolves from normal cells and tissues due to perturbations in molecular pathways the book describes the integration of molecular and cellular pathogenesis using a bioinformatics approach and a systems biology approach to disease pathogenesis it also discusses current and future strategies in molecular diagnosis of human disease and the impact of molecular diagnosis on treatment decisions and the practice of personalized medicine this book is a valuable resource for students biomedical researchers practicing physician scientists who undertake disease related basic science and translational research and pathology residents and other postdoctoral fellows exam master web site will host self assessment questions that students can use to study for the molecular section of the board exam

companion site will host a complete set of powerpoint slides to include images from the book and additional images for teaching course materials lecture materials teaches from the perspective of integrative systems biology which encompasses the intersection of all molecular aspects of biology as applied to understanding human disease outlines the principles and practice of molecular pathology explains the practice of molecular medicine and the translational aspects of molecular pathology

this book will take an evidence based approach to current knowledge about biomolecules and their place in our lives inviting readers to explore how we know what we know and how current gaps in knowledge may influence the way we approach the information biomolecular science is increasingly important in our everyday life influencing the choices we make about our diet our health and our wellness often however information about biomolecular science is presented as a list of immutable facts discouraging critical thought the book will introduce the basic tools of structural biology supply real life examples and encourage critical thought about aspects of biology that are still not fully understood

this book aims to describe the current state of knowledge and possible future developments in a number of major areas of research into the nature causes and treatment of cancer the

contributing authors have been encouraged to discuss their subjects at the molecular level it will become apparent to the reader that considerable developments in the understanding of the fundamental nature of cancer in molecular terms are constantly being made this is particularly the case in the area of oncogene research where differences between tumour and normal cells can now be defined in terms of altered expression of dna sequences an understanding of the methods available for detecting cancer of the process of carcinogenesis and of the means available for treating cancer can only be achieved with a precise knowledge of the basic biochemical and molecular processes involved since it is all too easy for the research scientist to become totally absorbed within the specialised area of research in which he is involved the first chapter is an attempt to encourage a broader field of vision by introducing the clinician's view of the cancer problem which illustrates the broad spectrum of basic problems that need to be solved by the cancer researcher

man s mind stretched to a new idea never goes back to its original dimensions oliver wendell holmes our current understanding of sex and biological differentiation results from the application of three principal experimental approaches to these subjects those of the physiologist the biochemist and the geneticist these three approaches are illustrated by the materials presented in the chapters of this volume chapters 1 5 emphasize conceptualization of developmental processes describing systems principally from the standpoint of the physiologist structures and functions are defined with only occasional reference to specific molecular details chapters 6 10 present the views of the biochemist attempting to describe functions influencing or regulating cellular behavior at the molecular level and chapters 11 14 illustrate the approaches of the modern day geneticist in his attempts to gain a detailed understanding of processes controlling gene expression while it is possible to delineate these three major sections each emphasizing a distinct experimental approach it must be realized that the yield of knowledge increases exponentially with the number of experimental approaches available to the investigator information resulting from the application of each of these approaches must converge to give the same answers for anyone biological phenomenon in anyone experimental system

further if we can learn of details regarding a particular process by applying different experimental approaches our postulates concerning the underlying molecular mechanisms are likely to be more accurate but biological systems are not unrelated

despite the fact that many years have elapsed since the first microcalorimetric measurements of an action potential were made there is still among the research workers involved in the study of bioelectrogenesis a complete overlooking of the most fundamental principle governing any biological phenomenon at the molecular scale of dimension this is surprising the more so that the techniques of molecular biology are applied to characterize the proteins forming the ionic conducting sites in living membranes for reasons that are still obscure to us the molecular aspects of bioelectrogenesis are completely out of the scope of the dynamic aspects of biochemistry even if it is sometimes recognized that an action potential is a free energy consuming entropy producing process the next question that should reasonably arise is never taken into consideration there is indeed a complete evasion of the problem of biochemical energy coupling thus reducing the bioelectrogenesis to only physical interactions of membrane proteins with the electric field the inbuilt postulate is that no molecular transformations in the chemical sense could be involved

people around the world are living longer for the first time in history most humans will live to be sixty and beyond by 2050 the world

s population aged 60 and over will reach a total of 2 billion up from 900 million in 2015 today 125 million people are 80 years of age or older by 2050 there will be 434 million people in this age group worldwide in addition the pace of aging of the world population is also increasing however there is not enough evidence to show that older people have better health than their parents while rates of severe disability have declined over the past 30 years but only in high income countries there have been no significant changes in mild to moderate disability over the same period of time indeed the increase in the duration of life lifespan does not coincide with the increase in the duration of health healthspan that is the period of life free from serious chronic diseases and disabilities therefore the identification of the factors that predispose to a long and healthy life as discussed in the papers of this book is of enormous interest for translational medicine
