this book is the first comprehensive overview of the emerging field of cuffless blood pressure monitoring increasing clinical evidence proves that longitudinal measurements of blood pressure allow for earlier detection and better management of multiple medical conditions and for superior prediction of cardiovascular events unfortunately today s clinical and industry standards for blood pressure monitoring still require the inflation of a pneumatic cuff around a limb each time a measurement is taken over the last decades clinicians scientists and device manufacturers have explored the feasibility of technologies that reduce or even completely eliminate the need of cuffs initiating the era of cuffless blood pressure monitoring among the existing literature this book is intended to be a practical guide to navigate across this emerging field the chapters of the handbook have been elaborated by experts and key opinion leaders in the domain and will guide the reader along the clinical scientific technical and regulatory aspects of cuffless blood pressure monitoring

hypertension remains a leading cause of disability and death worldwide self monitoring of blood pressure by patients at home is currently recommended as a valuable tool for the diagnosis and management of hypertension unfortunately in clinical practice home blood pressure monitoring is often inadequately implemented mostly due to the use of inaccurate devices and inappropriate methodologies thus the potential of the method to improve the management of hypertension and cardiovascular disease prevention has not yet been exhausted this volume presents the available evidence on home blood pressure monitoring discusses its strengths and limitations and presents strategies for its optimal implementation in clinical practice written by distinguished international experts it offers a complete source of information and guide for practitioners and researchers dealing with the management of hypertension

Ambulatory Blood Pressure Monitoring

the availability of new technologies that enable blood pressure to be measured and recorded continuously or repetitively during prolonged observation periods has created exciting opportunities for studying the physiology of blood pressure regulation and the characteristics of clinical hypertension ambulatory blood pressure monitoring has been based on three types of approach the first of these has utilized an intra arterial catheter that allows blood pressure to be measured directly and continuously during a full 24 hour period the second approach is based on non invasive techniques and utilizes devices capable of automatically inflating conventional arm cuffs and recording blood pressures at pre set intervals throughout the day the third and most simple method has depended upon semiautomated techniques that require the subject to inflate a cuff at convenient intervals during the period of observation during the last few years concerted research into these differing techniques has exposed their strengths and shortcomings overall however there has been a growing perception that these approaches to the measurement of blood pressure might add considerably to the information obtained in the doctor's office by the traditional single or casual reading this book summarizes the state of the art in ambulatory blood pressure monitoring

in addition to standardized casual blood pressure readings ambulatory blood pressure monitoring abpm using automatic noninvasive indirect devices for home readings and fully automated monitors for 24 h profiles have become a widely used necessary tool in clinical research this book summarizes the state of the art in the whole field of indirect blood pressure monitoring it is based on two international meetings and on invited papers we have divided the subject matter into two main areas 1 automatic blood pressure devices for discontinuous registration and 2 portable fully automated programmable monitors for continuous monitoring the availability of all new technologies is described in detail and current technical and physiological problems have been covered in depth both topics have been subdivided into a methods and techniques and b clinical applications both parts are updated and have critically evaluated available automatic sphygmomanometers and portable computers equipped with different techniques e.g. auscultation oscillometry plethysmography reliability in the intensive care unit as well as in outpatients management common clinical problems clinical relevance compared to casual blood pressure are described in the first part in the second part ten years of experience on fully automated noninvasive methodology compared to intraarterial techniques have been elaborated by international experts the possibilities and limitations are clearly demonstrated analyses in different clinical fields in the diagnosis of primary and secondary hypertension are given different statistical analyses of blood pressure variability and circadian rhythms are discussed

National High Blood Pressure Education Program (NHBPEP) Working Group Report on Ambulatory Blood Pressure Monitoring

1990

this book guides readers through the correct use and consequent diagnostic and therapeutic relevance of 24 h ambulatory blood pressure monitoring abpm in a wide spectrum of clinical presentations and different phenotypes of arterial hypertension on the basis of eight case studies the author reviews and discusses current guidelines and recommendations aimed at optimizing the diagnostic and therapeutic approach in commonly encountered real world clinical scenarios including challenging cases of white coat hypertension masked hypertension isolated nocturnal or diurnal hypertension hypertension and obstructive sleep apnea pseudo resistant and true resistant hypertension and drug induced hypotension this handy and practical book provides physicians in the area of general and internal medicine as well as specialists in cardiovascular risk valuable insights for optimizing the

this fascinating volume applies the concept of chronomics to the medical treatment of hypertension it starts with the recent updates on chronomics the analytic techniques and their application to community based assessments the authors advocate the use of 7 day 24 h records of blood pressure which is effective for finding masked hypertension masked morning surge and other rhythm abnormalities most organisms from cyanobacteria to mammals are known to use the circadian mechanism however our body systems also demonstrate circaseptan roughly weekly circannual roughly yearly and even longer rhythms chronomics monitors the physiological data and then analyzes the superimposed rhythms isolating the cycles mathematically to determine how organisms and their environment interact it is the study of interactions among time structures chronomes in and around us
