the informational nature of biological organization at levels from the genetic and epigenetic to the cognitive and linguistic information shapes biological organization in fundamental ways and at every organizational level because organisms use information including dna codes gene expression and chemical signaling to construct maintain repair and replicate themselves it would seem only natural to use information related ideas in our attempts to understand the general nature of living systems the causality by which they operate the difference between living and inanimate matter and the emergence in some biological species of cognition emotion and language and yet philosophers and scientists have been slow to do so this volume fills that gap information and living systems offers a collection of original chapters in which scientists and philosophers discuss the informational nature of biological organization at levels ranging from the genetic to the cognitive and linguistic the chapters examine not only familiar information related ideas intrinsic to the biological sciences but also broader information theoretic perspectives used to interpret their significance the contributors represent a range of disciplines including anthropology biology

chemistry cognitive science information theory philosophy psychology and systems theory thus demonstrating the deeply interdisciplinary nature of the volume s bioinformational theme
