inverse stefan problems for quasilinear parabolic equations in regions with free boundaries are developed the study of this new class of ill posed problems is motivated by the needs of the modeling and control of nonlinear processes with phase transitions in thermophysics and mechanics of continuous media inverse stefan problems are important for the perfection of technologies both in high temperature processes e g metallurgy the aircraft industry astronautics and power engineering and in hydrology exploitation of oil gas fields etc the proposed book will complete a gap in these subjects in the preceding researches of ill posed problems it contains the new theoretical and applied studies of a wide class of inverse stefan problems the statements of such problems on the determination of boundary functions and coefficients of the equation are considered for different types of additional information about their solution the variational method of obtaining stable approximate solutions is proposed and established it is implemented by an efficient computational scheme of descriptive regularization this algorithm utilizes a priori knowledge of the qualitative structure of the sought solution and ensures a substantial saving in computational costs it is tested on model and applied problems in nonlinear thermophysics in particular the results of calculations for important applications in continuous casting of ingots and in the melting of a plate with the help of laser technology are presented

most scientists and engineers are familiar with the name josef stefan primarily from the stefan boltzmann law which relates the amount of energy transferred by radiation to the absolute temperature raised to the fourth power stefan determined this law from experimental data and it was later theoretically verified by his former student ludwig boltzmann however it is interesting to know that this is the same stefan who lent his name to the solid liquid phase change problem and concepts related to molecular diffusion and convective motion driven by surface evaporation or ablation stefan counted among his students sigmund freud who was so inspired by his physics instructor that he incorporated scientific methods into psychoanalysis this invaluable book details not only josef stefan s original contributions in these areas but the current state of the art of his pioneering work

technological evolution and revolution are both driven by the discovery of new functionalities new materials and the design of yet smaller faster and more energy efficient components progress is being made at a breathtaking pace stimulated by the rapidly growing demand for more powerful and readily available information technology high speed internet and data streaming home automation tablets and smartphones are now necessities for our everyday lives consumer expectations for progressively more data storage and exchange appear to be insatiable oxide electronics is a promising and relatively new field that has the potential to trigger major advances in information technology oxide interfaces are particularly intriguing here low local symmetry combined with an increased susceptibility to external fields leads to unusual physical properties distinct from those of the homogeneous bulk in this context ferroic domain walls have attracted recent attention as a completely new type of oxide interface in addition to their functional properties such walls are spatially mobile and can be created moved and erased on demand this unique degree of flexibility enables domain walls to take an active role in future devices and hold a great potential as multifunctional 2d systems for nanoelectronics with domain walls as reconfigurable electronic 2d components a new generation of adaptive nano technology and flexible circuitry becomes possible that can be altered and upgraded throughout the lifetime of the device thus what started out as fundamental research at the limit of accessibility is finally maturing into a promising

concept for next generation technology

this volume of studies explores a particularly complex period in byzantine history the thirteenth century from the fourth crusade to the recapture of constantinople by exiled leaders from nicaea during this time there was no greek state based on constantinople and so no byzantine empire by traditional definition instead a venetian frankish alliance ruled from the capital while many smaller states also claimed the mantle of byzantium even after 1261 when the latin empire of constantinople was replaced by a restored greek state political fragmentation persisted this fragmentation makes the study of individuals more difficult but also more valuable than ever before and this volume demonstrates the very considerable advances in historical understanding that may be gained from prosopographical approaches specialist historians of the byzantine successor states of the period and of their most important neighbours here examine the self projection and interactions of these states combining military history and diplomacy commercial and theological contacts and the experiences and self description of individuals this wide ranging series of articles uses a great diversity of sources arabic armenian bulgarian greek latin persian and serbian to exploit the potential of the novel methodology employed and of prosopography as an additional historical tool of analysis

researchers and managers of regulated river systems will find this volume useful in acquiring information for deciding an integrated management plan for regulated river operations rather than the ecological theory of impacts of flow regulation emphasis has been placed on methods to predict water quality and habitat alterations as well as techniques to mitigate impacts from various operational scenarios although most chapters refer to impacts of riverine impoundments these alternatives apply to any regulated situation in which changes in water quality or flow pattern occur the predictive modeling techniques are explained primarily from a theoretical background however extensive bibliographies can guide the uninitiated to specific texts and software where controversial techniques have been presented alternate methods are also described major topic areas include water quality problems channel modification and management ecological modeling and management as well as a section on perspectives for ecological management and special problems in developing nations

modelling of heterogeneous processes such as electrochemical reactions extraction or ion exchange usually requires solving the transport problem associated to the process since the processes at the

phase boundary are described by scalar quantities and transport quantities are vectors or tensors coupling of them can take place only via conservation of mass charge or momentum in this book transport of ionic species is addressed in a versatile manner emphasizing the mutual coupling of fluxes in particular treatment is based on the formalism of irreversible thermodynamics i e on linear ionic phenomenological equations from which the most frequently used nernst planck equation is derived limitations and assumptions made are thoroughly discussed the nernst planck equation is applied to selected problems at the electrodes and in membranes mathematical derivations are presented in detail so that the reader can learn the methodology of solving transport problems each chapter contains a large number of exercises some of them more demanding than others
