case reports and clinical trials conducted in various countries show more and more frequently a positive correlation between the presence of original teeth and prevalence of root caries in older age because this is a global trend it is likely that the predicted increase in the worldwide elderly population may soon cause a significant increase in the number of people requiring effective means of preventing and treating root surface caries in response to this development a team of outstanding contributors has reviewed the most important aspects of root caries this new volume presents their findings along with discussions of how to deal with this health issue that progressively affects the oral health balance the chapters in this book are divided in four core parts epidemiology biological determinants lesion assessment and features and preventive and operative therapies the collection of state of the art articles provides a broad overview and will serve as a reference for clinicians as well as scientists and hopefully will encourage new research

this book explains how to optimize clinical conditions for detection of the earliest visible signs of dental

caries and how best to assess caries activity as a basis for effective management the available evidence from the literature on detection criteria and methods is distilled and placed in a clinical context to facilitate implementation in clinical practice guidance is offered on removal of the dental biofilm and the potential impact of various factors on the performance of different caries detection devices the histological changes that occur during the caries process and their effect on the clinical appearance of caries lesions are explained in addition several caries classification systems based on visual detection criteria and designed to allow staging are presented consideration is also given to currently marketed detection aids including methods involving light fluorescence transillumination and radiography in each case a summary of the detection performance based on available supporting evidence is tabulated together with advice on appropriate clinical application the reader will find the text to be clearly written and informative with many supporting clinical images

currently there is no reason in most cases of cavitated caries lesions to remove affected tissue this book presents evidence based research on the topic and provides assessments of diagnostic devices it offers new insights into how a dentine carious cavity can be managed by either tissue removal or restoration methods for preserving dental tissue are presented and ample evidence highlights the need to seal with a quality restorative material an update on how to conduct a randomized clinical trial is followed by a chapter on agreed upon terminology for supporting improved communication among oral health professionals around the world this is a must read for general practitioners restorative specialists dental students and oral hygienists therapists

Dental Caries, a Critical Summary

1884

dental caries tooth decay is one of the most highly prevalent diseases around the world affecting a significant proportion of the population dental caries may take place on any tooth surface in the oral cavity where dental plaque is allowed to develop over a period of time understanding its causes and progression allows the dental team to help the patient control and manage it so that patients can maintain healthy teeth for life the fourth edition of essentials of dental caries provides readers with an up to date clinically relevant guide to dental caries written in an accessible style the authors explain the biological and socioeconomic background of lesion development and progress current methods of clinical diagnosis and evidence based management are outlined in clearly laid out and highly illustrated chapters this book is essential reading for students and practitioners of dentistry dental therapy dental hygiene and oral health educators

for many years we have known that dental caries is one of the most common diseases of mankind only few people have sound teeth till the end of life formerly we thought that the only possibility to keep our teeth in good state was to go to the dentist regularly since we know how complicated our nutrition is we know too that we have to regard the composition of our food as a principal factor influencing the state of our teeth the trace elements e.g. play an important role studies with tracers during the last decades have shown that the minerals are metabolized very

actively by living organisms thus research in our laboratory together with prof sizoo and prof ools has demonstrated that intravenously injected radio active phosphorus has disappeared from the blood already half an hour after injection even the hard dental substance participates in this active metabolism
