## **L'Expedition du Duc de Guise à Naples**

1875

aiming to bridge theory and practice each chapter outlines relevant literature highlights key areas for consideration and offers suggestions for real world application the book will be of interest to researchers university students expedition organisers and outdoor instructors

## ***Italian Antarctic Expedition 1996-1997 Earth Sciences***

1998

this special report comprehensively describes the stratigraphy and correlation of the tertiary paleogene neogene rocks of nw europe and the adjacent atlantic ocean and is the summation of fifty years of research on tertiary sediments by chris king his book is essential reading for all geologists who deal with tertiary rocks across nw europe including those in the petroleum industry and geotechnical services as well as academic stratigraphers and palaeontologists introductory sections on chronostratigraphy biostratigraphy and other methods of dating and correlation are followed by a regional summary of tertiary sedimentary basins and their framework and an introduction to tertiary igneous rocks the third and largest segment comprises the regional stratigraphic summaries regions covered are the north sea basin onshore areas of southern england and the eastern english channel area the north atlantic margins including non marine basins in the irish sea and elsewhere and the paleogene igneous rocks of scotland

## **Soviet Antarctic Expedition**

1965

a comprehensive and richly illustrated overview of the gulf of mexico basin including its reservoirs source rocks tectonics and evolution

Annales ecclesiastici quos post Caesarem s.r.e. card. Baronivm, Odoricvm Raynaldvm ac Iacobvm Laderchivm ... ab an. MDLXXII. ad nostra vsque tempora continvat

1856

this book provides an integrated thorough and up to date review of the nature and development of the kalahari environment an environment of great ecological and geomorphological diversity its complex climatic and geological history and its long association with human societies attempting to utilise its natural resources are aspects of increasing scientific interest the book has evolved from the authors own research in the kalahari and attempts to provide explanations and answers to some of the many questions raised about this region ranging from the commonly asked is it really a desert to more specific and detailed concerns the interdisciplinary approach will make the book of interest to researchers lecturers and advanced students in earth sciences environmental studies tropical geomorphology and quaternary science the extensive bibliography will also make the book a very important source of reference

deep subsurface microbiology is a highly active and rapidly advancing research field at the interface of microbiology and the geosciences it focuses on the detection identification quantification cultivation and activity measurements of bacteria archaea and eukaryotes that permeate the subsurface biosphere of deep marine sediments and the basaltic ocean and continental crust the deep subsurface biosphere abounds with uncultured only recently discovered and at best incompletely understood microbial populations in spatial extent and volume earth s subsurface biosphere is only rivaled by the deep sea water column so far no deep subsurface sediment has been found that is entirely devoid of microbial life microbial cells and dna remain detectable at sediment depths of more than 1 km microbial life permeates deeply buried hydrocarbon reservoirs and is also found several kilometers down in continental crust aquifers severe energy limitation either as electron acceptor or donor shortage and scarcity of microbially degradable organic carbon sources are among the evolutionary pressures that have shaped the genomic and physiological repertoire of the deep subsurface biosphere its biogeochemical role as long term organic carbon repository inorganic electron and energy source and subduction recycling engine continues to be explored by current research at the interface of microbiology geochemistry and biosphere geosphere evolution this research topic addresses some of the central research questions about deep subsurface microbiology and biogeochemistry phylogenetic and physiological microbial diversity in the deep subsurface microbial activity and survival strategies in severely energy limited subsurface habitats microbial activity as reflected in process rates and gene expression patterns biogeographic isolation and connectivity in deep subsurface microbial communities the ecological standing of subsurface biospheres in comparison to the surface biosphere an independently flourishing biosphere or mere survivors that tolerate burial along with organic carbon compounds or a combination of both advancing these questions on earth s deep subsurface biosphere redefines the habitat range environmental tolerance activity and diversity of microbial life

## ***A revised correlation of Tertiary rocks in the British Isles and adjacent areas of NW Europe***

the great sand sea in egypt presents the history of one of the large sand seas in the sahara beginning with the

sand supply by fluvial transport from partly distant areas and also by local sandstone weathering it also details sand as carrier of information and shows the possibilities of sedimentary analysis in dealing with such a topic simple measurements may supply important information e g salinity measurements well known methods can be developed further to answer special questions a wealth of information can be drawn from especially adapted sedimentological investigations in the end bits of information from different analytical sources can be put together to reveal the history of a large sand sea analyzes different geological sources to decipher the history of the great sand sea presents the possibilities of sedimentary analysis to interpret the history of an area develops well known methods to further answer special questions

## ***Selected Water Resources Abstracts***

1991

this extraordinary handbook was inspired by the distinctive concerns of anthropologists and others who film people in the field the authors cover the practical technical and theoretical aspects of filming from fundraising to exhibition in lucid and complete detail information never before assembled in one place the first section discusses filmmaking styles and the assumptions that frequently hide unacknowledged behind them as well as the practical and ethical issues involved in moving from fieldwork to filmmaking the second section concisely and clearly explains the technical aspects including how to select and use equipment how to shoot film and video and the reasons for choosing one or the other and how to record sound finally the third section outlines the entire process of filmmaking preproduction production postproduction and distribution filled with useful illustrations and covering documentary and ethnographic filmmaking of all kinds cross cultural filmmaking will be as essential to the anthropologist or independent documentarian on location as to the student in the classroom

## **The Gulf of Mexico Sedimentary Basin**

a lake as a body of water is in continuous interaction with the rocks and soils in its drainage basin the atmosphere and surface and groundwaters human industrial and agricultural activities introduce new inputs and processes into lake systems this volume is a selection of ten contributions dealing with diverse aspects of lake systems including such subjects as the geological controls of lake basins and their histories mixing and circulation patterns in lakes gaseous exchange between the water and atmosphere and human input to lakes through atmospheric precipitation and surficial runoff this work was written with a dual goal in mind to serve as a

textbook and to provide professionals with in depth expositions and discussions of the more important aspects of lake systems

## Backpacker

2007-09

permeability is the primary control on fluid flow in the earth s crust and is key to a surprisingly wide range of geological processes because it controls the advection of heat and solutes and the generation of anomalous pore pressures the practical importance of permeability and the potential for large dynamic changes in permeability is highlighted by ongoing issues associated with hydraulic fracturing for hydrocarbon production fracking enhanced geothermal systems and geologic carbon sequestration although there are thousands of research papers on crustal permeability this is the first book length treatment this book bridges the historical dichotomy between the hydrogeologic perspective of permeability as a static material property and the perspective of other earth scientists who have long recognized permeability as a dynamic parameter that changes in response to tectonism fluid production and geochemical reactions

## Selected Water Resources Abstracts

1991

this volume contains 22 chapters introducing a wide range of semi arid and geologic landscapes botswana a thinly populated nation the size of france is a southern african keystone country at the heart of the kalahari sharing some of the major sub continental drainage basins such as the limpopo zambezi orange and okavango with its neighbouring countries the extensive kalahari sand surface has been sculptured by numerous past processes which have produced subtle but regional landforms consisting of extensive dunes and shorelines incipient rifting has created the dynamic okavango and makgadikgadi fan basin systems which produces iconic wetlands with a world heritage status geological outcrops in particular to the east expose highly denuded basement lithologies which produces numerous inselbergs that are home to a rich archaeological heritage the book also examines the geomorphology of mineral and water resources which sustain the economy and population and also features dedicated chapters that cover diamondiferous kimberlites caves pans dams duricrusts and wildlife chapter 6 is available open access under a creative commons attribution 4 0 international license via link springer com
