ethnomusicology is an academic discipline with a very broad mandate to understand why and how human beings are musical through the study of music in all its geographical and historical diversity ethnomusicological scholarship however has been remiss in articulating such goals methods and theories a renowned figure in the field timothy rice is one of the few scholars to regularly address this problem in this volume he offers a compilation of essays drawn from across his career that finds implicit and yet largely unrecognized patterns unifying ethnomusicology over its recent history modeling ethnomusicology summarizes thirty years of thinking about the field of ethnomusicology as rice frames and reframes the content of eight of his most important essays from their original context in relation to the environment of today s ethnomusicology rice proposes a variety of models meant to guide students and researchers in their study of ethnomusicology some of these models pull together disparate strands of the field while others propose heuristic models that generate questions for researchers as they plan and conduct their research a new introduction to these essays reviews the history of his writing about ethnomusicology and proposes an innovative model for theorizing in ethnomusicology by ethnomusicologists this book will be an enduring essential text in undergraduate and graduate ethnomusicology classrooms as well as a must buy for established scholars in the field

the bankruptcy prediction model z scorem for italian manufacturing listed companies and z scorem for italian industrial company the work stems from the study of the probability of default started in 2007 and continues today in particular this analysis is taken up with the study of the rating and the credit and liquidity risk carried out during the author s research doctorate the study is the continuation of other recently published author s e books the main objective is to identify a model for italian companies based on altman s z score variables several researchers have analyzed the probability of failure of large companies listed or emerging markets other authors have tried to create a dashboard useful for the analysis of key indicators to be monitored but this research differs for the creation of a specific indicator for the italian industrial companies based on altman variables

this fully revised 3rd edition offers an introduction to optimal control theory and its diverse applications in management science and economics it brings to students the concept of the maximum principle in continuous as well as discrete time by using dynamic programming and kuhn tucker theory while some mathematical background is needed the emphasis of the book is not on

mathematical rigor but on modeling realistic situations faced in business and economics the book exploits optimal control theory to the functional areas of management including finance production and marketing and to economics of growth and of natural resources in addition this new edition features materials on stochastic nash and stackelberg differential games and an adverse selection model in the principal agent framework the book provides exercises for each chapter and answers to selected exercises to help deepen the understanding of the material presented also included are appendices comprised of supplementary material on the solution of differential equations the calculus of variations and its relationships to the maximum principle and special topics including the kalman filter certainty equivalence singular control a global saddle point theorem sethi skiba points and distributed parameter systems optimal control methods are used to determine optimal ways to control a dynamic system the theoretical work in this field serves as a foundation for the book which the author has applied to business management problems developed from his research and classroom instruction the new edition has been completely refined and brought up to date ultimately this should continue to be a valuable resource for graduate courses on applied optimal control theory but also for financial and industrial engineers economists and operational researchers concerned with the application of dynamic optimization in their fields

toxic chemicals can exert effects on all levels of the biological hierarchy from cells to organs to organisms to populations to entire ecosystems however most risk assessment models express their results in terms of effects on individual organisms without corresponding information on how populations groups of species or whole ecosystems may respond to chemical stressors ecological modeling in risk assessment chemical effects on populations ecosystems and landscapes takes a new approach by compiling and evaluating models that can be used in assessing risk at the population ecosystem and landscape levels the authors give an overview of the current process of ecological risk assessment for toxic chemicals and of how modeling of populations ecosystems and landscapes could improve the status quo they present a classification of ecological models and explain the differences between population ecosystem landscape and toxicity extrapolation models the authors describe the model evaluation process and define evaluation criteria finally the results of the model evaluations are presented in a concise format with recommendations on modeling approaches to use now and develop further the authors present and evaluate various models on the basis of their realism and complexity prediction of relevant assessment endpoints treatment of uncertainty regulatory acceptance resource efficiency and other criteria they provide models that will improve the ecological relevance of risk assessments and make data collection more cost effective ecological modeling in risk assessment serves as a reference for selecting and applying the best models when performing a risk assessment
