the benefits of programming in a functional style are well known in particular algorithms that are expressed as compositions of functions operating on series vectors streams of data elements are much easier to understand and modify than equivalent algorithms expressed as loops unfortunately many programmers hesitate to use series expressions because they are typically implemented very inefficiently a common lisp macro package oss has been implemented which supports a restricted class of series expressions it obviously synchronizable series expressions which can be evaluated very efficiently by automatically converting them into loops using this macro package programmers can obtain the advantages of expressing computations as series expressions without incurring any run time overhead

silicon technology now allows us to build chips consisting of tens of millions of transistors this technology not only promises new levels of system integration onto a single chip but also presents significant challenges to the chip designer as a result many asic developers and silicon vendors are re examining their design methodologies searching for ways to make effective use of the huge numbers of gates now available these designers see current design tools and methodologies as inadequate for developing million gate asics from scratch there is considerable pressure to keep design team size and design schedules constant even as design complexities grow tools are not providing the productivity gains required to keep pace with the increasing gate counts available from deep submicron technology design reuse the use of pre designed and pre verified cores is the most promising opportunity to bridge the gap between available gate count and designer productivity reuse methodology manual for system on a chip designs second edition outlines an effective methodology for creating reusable designs for use in a system on a chip soc design methodology silicon and tool technologies move so quickly that no single methodology can provide a permanent solution to this highly dynamic problem instead this manual is an attempt to capture and incrementally improve on current best practices in the industry and to give a coherent integrated view of the design process reuse methodology manual for system on a chip designs second edition will be updated on a regular basis as a result of changing technology and improved insight into the problems of design reuse and its role in producing high quality soc designs

Reuse Methodology Manual 2012-12-06

reuse methodology manual for system on a chip designs third edition outlines a set of best practices for creating reusable designs for use in an soc design methodology these practices are based on the authors experience in developing reusable designs as well as the experience of design teams in many companies around the world silicon and tool technologies move so quickly that many of the details of design for reuse will undoubtedly continue to evolve over time but the fundamental aspects of the methodology described in this book have become widely adopted and are likely to form the foundation of chip design for some time to come development methodology

necessarily differs between system designers and processor designers as well as between dsp developers and chipset developers however there is a common set of problems facing everyone who is designing complex chips in response to these problems design teams have adopted a block based design approach that emphasizes design reuse reusing macros sometimes called cores that have already been designed and verified helps to address all of the problems above however in adopting reuse based design design teams have run into a significant problem reusing blocks that have not been explicitly designed for reuse has often provided little or no benefit to the team the effort to integrate a pre existing block into new designs can become prohibitively high if the block does not provide the right views the right documentation and the right functionality from this experience design teams have realized that reuse based design requires an explicit methodology for developing reusable macros that are easy to integrate into soc designs this manual focuses on describing these techniques features of the third edition up to date state of the art reuse as a solution for circuit designers a chronicle of best practices all chapters updated and revised generic guidelines non tool specific emphasis on hard ip and physical design

although no one is probably too enthused about the idea it is a fact that the development of most empirical sciences to a great extent depends on the development of data analysis methods and techniques which due to the necessity of application of computers for that purpose actually means that it practically depends on the advancement and orientation of computer statistics every other year the international association for statistical computing sponsors the organization of meetings of individual s professiona77y involved in computational statistics since these meetings attract professionals from allover the world they are a good sample for the estimation of trends in this area which some believe is a statistics proper while others claim it is computer science it seems though that an increasing number of colleagues treat it as an independent scientific or at least technical discipline this volume contains six invited papers 41 contributed papers and finally two papers which are formally software descriptions but it was agreed by the program committee that they should be included in a separate section entitled notes about new developments in statistical software due to their special significance for current trends in computational statistics
