bacomet cannot be evaluated solely on the basis of its publications it is important then that the reader with only this volume on which to judge both the bacomet activities and its major outcome to date should know some thing of what preceded this book s publication for it is the story of how a group of educators mainly tutors of student teachers of mathematics com mitted themselves to a continuing period of work and self education the concept of bacomet developed during a series of meetings held in 1978 79 between the three editors bent christiansen geoffrey howson and michael otte at which

~~we expressed our concern about the contributions from mathematics education as a discipline to~~ teacher education both as we observed it and as we participated in it the short time which was at the teacher educator s disposal allied to the limited knowledge and experience of the students on which one had to build raised puzzling problems concerning priorities and emphases the recognition that these problems were shared by educators from many different countries was matched by the fact that it would be fruitless to attempt to search for an internationally or even nationally acceptable solution to our problems different contexts and traditions rule this out

the interaction of the history of mathematics and mathematics education has long been construed as an esoteric area of inquiry much of the research done in this realm has been under the auspices of the history and pedagogy of mathematics group however there is little systematization or consolidation of the existing literature aimed at undergraduate mathematics education particularly in the teaching and learning of the history of mathematics and other undergraduate topics in this monograph the chapters cover topics such as the development of calculus through the actuarial sciences and map making logarithms the people and practices behind real world mathematics and fruitful ways in which the history of mathematics informs mathematics education the book is meant to serve as a source of enrichment for undergraduate mathematics majors and for mathematics education courses aimed at teachers

this little book is conceived as a service to mathematicians attending the 1998 international congress of mathematicians in berlin it presents a comprehensive condensed overview of mathematical activity in berlin from leibniz almost to the present day without however including biographies of living mathematicians since many towering figures in mathematical history worked in berlin most of the chapters of this book are concise biographies these are held together by a few survey articles presenting the overall development of entire periods of scientific life at berlin overlaps between various chapters and differences in style between the chap ters were inevitable but sometimes this provided opportunities to show different aspects of a single historical event for instance the kronecker weierstrass con troversy the book aims at readability rather than scholarly completeness there are no footnotes only references to the individual bibliographies of each chapter still we do hope that the texts brought together here and written by the various authors for this volume constitute a solid introduction to the history of berlin mathematics

modern mathematics is constructed rigorously through proofs based on truths which are either axioms or previously proven theorems thus it is par excellence a model of rational inquiry links between cognitive psychology and mathematics education have been particularly strong during the last decades indeed the enlightenment view of the rational human mind that reasons makes decisions and solves problems based on logic and probabilities was shaken during the second half of the twentieth century cognitive psychologists discovered that humans thoughts and actions often deviate from rules imposed by strict normative theories of inference yet these deviations should not be called errors as cognitive psychologists have demonstrated these deviations may be either valid heuristics that succeed in the environments in which humans have evolved or biases that are caused by a lack of adaptation to abstract information formats humans as the cognitive psychologist and economist herbert simon claimed do not usually optimize but rather satisfice even when solving problem this research topic aims at demonstrating that these insights have had a decisive impact on mathematics education we want to stress that we are concerned with the view of bounded rationality that is different from the one espoused by the heuristics and biases program in simon s bounded rationality and its direct descendant ecological rationality rationality is understood in terms of cognitive success in the world correspondence rather than in terms of conformity to content free norms of coherence e g transitivity
