this book arose from courses taught by the authors and is designed for both instructional and reference use during and after a first course in algebraic topology it is a handbook for users who want to calculate but whose main interests are in applications using the current literature rather than in developing the theory typical areas of applications are differential geometry and theoretical physics we start gently with numerous pictures to illustrate the fundamental ideas and constructions in homotopy theory that are needed in later chapters we show how to calculate homotopy groups homology groups and cohomology rings of most of the major theories exact homotopy sequences of fibrations some important spectral sequences and all the obstructions that we can compute from these our approach is to mix illustrative examples with those proofs that actually develop transferable calculational aids we give extensive appendices with notes on background material extensive tables of data and a thorough index audience graduate students and professionals in mathematics and physics

this book grew from a one semester course offered for many years to a mixed audience of graduate and undergraduate students who have not had the luxury of taking a course in measure theory the core of the book covers the basic topics of independence conditioning martingales convergence in distribution and fourier transforms in addition there are numerous sections treating topics traditionally thought of as more advanced such as coupling and the kmt strong approximation option pricing via the equivalent martingale measure and the isoperimetric inequality for gaussian processes the book is not just a presentation of mathematical theory but is also a discussion of why that theory takes its current form it will be a secure starting point for anyone who needs to invoke rigorous probabilistic arguments and understand what they mean

this thesis introduces novel and significant results regarding the analysis and synthesis of positive systems especially under l1 and l1 performance it describes stability analysis controller synthesis and bounding positivity preserving observer and filtering design for a variety of both discrete and continuous positive systems it subsequently derives computationally efficient solutions based on linear programming in terms of matrix inequalities as well as a number of analytical solutions obtained for special cases the thesis applies a range of novel approaches and fundamental techniques to the further study of positive systems thus contributing significantly to the theory of positive systems a hot topic in the field of control

this book contains a collection of quantitative procedures in common use in pharmacology and related disciplines it is intended for students and researchers in all fields who work with drugs many physicians especially those concerned with clinical pharmacology will also find much that is useful the procedures included may be considered core since they are generally applicable to all classes of drugs some of the procedures deal with statistics and hence have even wider application in this new edition we have increased the number of procedures from 33 in the first edition to 48 other procedures have been revised and expanded yet the basic philosophy of this new edition remains unchanged from the first that is the pharmacologic basis of each procedure is presented along with the necessary formulas and one or more worked examples an associated computer program is included for each procedure and its use is illustrated with the same worked example used in the text the discussions of theory and the sample computations are brief and self contained so that all computations can be made with the aid of a pocket calculator and the statistical tables contained in appendix a yet it is realized
