in the context of complex systems so far has not attracted the interest it deserves the present volume is an attempt toward filling this gap there exist various useful tools for the study of complex time delay systems at the forefront is the mathematical theory of delay equations a relatively mature field in many aspects which provides some powerful techniques for analytical inquiries along with some other tools from statistical physics graph theory computer science dynamical systems theory probability theory simulation and optimization software and so on nevertheless the use of these methods requires a certain synergy to address complex systems problems especially in the presence of time delays this book collects papers from the 8th conference on non integer order calculus and its applications that have been held on september 20 21 2016 in zakopane poland the preceding two conferences were held in szczecin poland in 2015 and in opole poland in 2014 this conference provides a platform for academic exchange on the theory and application of fractional calculus between domestic and international universities research institutes corporate experts and scholars the proceedings of the 8th conference on non integer order calculus and its applications 2016 brings together rigorously reviewed contributions from leading international experts the included papers cover novel various important aspects of mathematical foundations of fractional calculus modeling and control of fractional systems as well as controllability detectability observability and stability problems for these systems the workshop for women in graph theory and applications was held at the institute for mathematics and its applications university of minnesota minneapolis on august 19 23 2019 during this five day workshop 42 participants performed collaborative research in six teams each focused on open problems in different areas of graph theory and its applications the research work of each team was led by two experts in the corresponding area who prior to the workshop carefully selected relevant and meaningful open problems that would yield high quality research and results of strong impact as a result all six teams have made significant contributions to several open problems in their respective areas the workshop led to the creation of the women in graph theory and applications research collaboration network which provided the framework to continue collaborating and to produce this volume this book contains six chapters each of them on one of the different areas of research at the workshop for women in graph theory and applications and written by participants of each team the breadth of matrix theory's applications is reflected by this volume which features material of interest to applied mathematicians as well as to control engineers studying stability of a servo mechanism and numerical analysts evaluating the roots of a polynomial starting with a survey of complex symmetric antisymmetric and orthogonal matrices the text advances to explorations of singular bundles of matrices and matrices with nonnegative elements applied mathematicians will take particular note of the full and readable chapter on applications of matrix theory to the study of systems of linear differential equations and the text concludes with an exposition on the routh hurwitz problem plus several helpful appendixes 1959 edition

category theory now permeates most of mathematics large parts of theoretical computer science and parts of theoretical physics its unifying power brings together different branches and leads to a better understanding of their roots this book is addressed to students and researchers of these fields and can be used as a text for a first course in category theory it covers the basic tools like universal properties limits adjoint functors and monads these are presented in a concrete way starting from examples and exercises taken from elementary algebra lattice theory and topology then developing the theory together with new exercises and applications a reader should have some elementary knowledge of these three subjects or at least two of them in order to be able to follow the main examples appreciate the unifying power of the categorical approach and discover the subterranean links brought to light and formalised by this perspective applications of category theory form a vast and differentiated domain this book wants to present the basic applications in algebra and topology with a choice of more advanced ones based on the interests of the author references are given for applications in many other fields in this second edition the book has been entirely reviewed adding many applications and exercises all non obvious exercises have now a solution or a reference in the case of an advanced topic solutions are now collected in the last chapter

one of the major contemporary challenges in both physical and social sciences is modeling analyzing and understanding the self organization evolution behavior and eventual decay of complex dynamical systems ranging from cell assemblies to the human brain to animal societies the multi faceted problems in this domain require a wide range of methods from various scientific disciplines there is no question that the inclusion of time delays in complex system models considerably enriches the challenges presented by the problems although this inclusion often becomes inevitable as real world applications demand more and more realistic models the role of time delays in the context of complex systems so far has not attracted the interest it deserves the present volume is an attempt toward filling this gap there exist various useful tools for the study of complex time delay systems at the forefront is the mathematical theory of delay equations a relatively mature field in many aspects which provides some powerful techniques for analytical inquiries along with some other tools from statistical physics graph theory computer science dynamical systems theory probability theory simulation and optimization software and so on nevertheless the use of these methods requires a certain synergy to address complex systems problems especially in the presence of time delays
