Dysphagia in Rare Conditions

2009-11-15

this is the first book to concentrate on dysphagia in rare conditions those that occur infrequently or those that may occur more frequently but are only sometimes associated with dysphagia covering a wide range of conditions from progressive supranuclear palsy psp through connective tissue disease to conditions as diverse as west nile virus the editors and expert contributors efficiently synthesize the available information to provide the essentials needed to help clinicians to perform sophisticated assessments based on their knowledge of both the conditions and the expected swallowing signs and treatments each entry covers the neurology of the given condition including the signs and symptoms neuropathology epidemiology and genetics thereafter coverage of swallowing in each condition examines the diagnostic signs and symptoms etiology swallowing neuropathology associated cognitive linguistic and communicative signs and symptoms special diagnostic considerations treatment nutrition hydration and medications

stuttering and cluttering provides a comprehensive overview of both theoretical and treatment aspects of disorders of fluency stuttering also known as stammering and the lesser known cluttering the book demonstrates how treatment strategies relate to the various theories as to why stuttering and cluttering arise and how they develop uniquely it outlines the major approaches to treatment alongside alternative methods including drug treatment and recent auditory feedback procedures part one looks at different perspectives on causation and development emphasizing that in many cases these apparently different approaches are inextricably intertwined part two covers the assessment diagnosis treatment and evaluation of stuttering and cluttering in addition to chapters on established approaches there are sections on alternative therapies including drug therapy and auditory feedback together with a chapter on counselling reference is made to a number of established treatment programs but the focus is on the more detailed description of specific landmark approaches these provide a framework from which the reader may not only understand others treatment procedures but also a perspective from which they can develop their own offering a clear accessible and comprehensive account of both the theoretical underpinning of stammering therapy and its practical implications the book will be of interest to speech language therapy students as well as qualified therapists psychologists and to those who stutter and clutter

this book is relevant for language testers listening researchers and oral proficiency teachers in that it explores four broad themes related to the assessment of l2 listening ability the use of authentic real world spoken texts the effects of different speech varieties of listening inputs the use of audio visual texts and assessing listening as part of an interactive speaking listening construct each theme is introduced with a review of the relevant literature and then is examined through either two or three empirical studies the notion of authenticity underlies each of these four themes by creating more authentic test tasks that are similar to real world language tasks test developers can create listening assessments that not only more effectively assess test takers communicative competence but can also have a positive washback effect on educational systems

when we think about expertise we usually consider people who master tasks at a level not reachable by most other people although we rarely realise it however most humans are experts in many aspects of everyday life this expertise enables us to find our way through a complex environment that is our life for instance we can instantly recognise multiple objects and relations between them to form a meaningful unit such as an office thus research on expertise is not only important to investigate the cognitive and neural processes within an elite group but it is also a

powerful tool to understand how everyone can acquire complex skills the goal of this research topic is to shed further light on the common and distinct neural mechanisms that implement various kinds of expertise we broadly define expertise as skill in any perceptual cognitive social or motor domain with the common core being optimised information processing due to knowledge acquired from repeated experiences thus we are interested in the full range of mental processes modulated or modified by expertise from simple object or pattern recognition to complex decision making or problem solving in a particular domain these domains can range from everyday or occupational expertise to sports and rather artificial domains such as board games in all cases the aim should be to elucidate how the brain implements these sometimes incredible feats we are particularly interested in connecting cognitive theories about expertise and expertise related performance differences with models and data on the neural implementation of expertise we welcome original research contributions using the full range of behavioural neuroscience methods as well as theoretical methodological or historical reviews and opinion papers focusing on any of the above mentioned aspects

stuttering and cluttering provides a clear accessible and wide ranging overview of both the theoretical and clinical aspects of two disorders of fluency stuttering and cluttering this edition remains loyal to the idea that stuttering and cluttering can best be understood by first considering various overarching frameworks which can then be expanded upon and provides a clear position

from which to disentangle the often complex interrelationships of these frameworks the book is divided into two parts the first of which mainly deals with theory and aetiology while the second focuses on clinical aspects of assessment diagnosis and treatment the book also provides frequent references across parts i and ii to help link the various areas of investigation together this revised edition of stuttering and cluttering reflects the major changes in thinking regarding both theory and therapy that have taken place since the publication of the first edition as well as those who stutter and clutter the book will be invaluable for speech language therapy speech language pathology students practicing clinicians psychologists and linguists around the world

communication is vital for social participation however communication often takes place under suboptimal conditions this makes communication harder and less reliable leading at worst to social isolation in order to promote participation it is necessary to understand the mechanisms underlying communication in different situations human communication is often speech based either oral or written but may also involve gesture either accompanying speech or in the form of sign language

for communication to be achieved a signal generated by one person has to be perceived by another person attended to comprehended and responded to this process may be hindered by adverse conditions including factors that may be internal to the sender e g incomplete or idiosyncratic language production occur during transmission e g background noise or signal processing or be internal to the receiver e g poor grasp of the language or sensory impairment the extent to which these factors interact to generate adverse conditions may differ across the lifespan recent work has shown that successful speech communication under adverse conditions is associated with good cognitive capacity including efficient working memory and executive abilities such as updating and inhibition further frontoparietal networks associated with working memory and executive function have been shown to be activated to a greater degree when it is harder to achieve speech comprehension to date less work has focused on sign language communication under adverse conditions or the role of gestures accompanying speech communication under adverse conditions it has been proposed that the role of working memory in communication under such conditions is to keep fragments of an incomplete signal in mind updating them as appropriate and inhibiting irrelevant information until an adequate match can be achieved with lexical and semantic representations held in long term memory recent models of working memory highlight an episodic buffer whose role is the multimodal integration of information from the senses and long term memory it is likely that the episodic buffer plays a key role in communication under adverse conditions the aim of this research topic is to draw together multiple perspectives on communication under adverse conditions including empirical and theoretical approaches this will facilitate a scientific exchange among individual scientists and groups studying different aspects of communication under adverse conditions and or the role of cognition in communication as such this topic belongs firmly within the field of cognitive hearing science exchange of ideas among scientists with different perspectives on these issues will allow researchers to identify and highlight the way

in which different internal and external factors interact to make communication in different modalities more or less successful across the lifespan such exchange is the forerunner of broader dissemination of results which ultimately may make it possible to take measures to reduce adverse conditions thus facilitating communication such measures might be implemented in relation to the built environment the design of hearing aids and public awareness

this book contains contributions by scholars working on diverse aspects of speech who bring their findings to bear on the practical issue of how to treat stuttering in different language groups and in multilingual speakers the book considers classic issues in speech production research as well as whether regions of the brain that are affected in people who stutter relate to areas used intensively in fluent bilingual speech it then reviews how formal language properties and differential use of parts of language affect stuttering in english and then compares these findings to work on stuttering in a variety of languages finally the book addresses methodological issues to do with studies on bilingualism and stuttering and discusses which approach is appropriate in the treatment of bilingual and multilingual people who stutter

although cerebral dominance the specialization of each side of the brain for different functions was discovered in the 1860s almost nothing was known for many years about its biological foundations the study of which has undergone what can only be described as a revolution in the past decade and a half norman geschwind and albert galaburda two of the leaders of this new field have

assembled a distinguished group of investigators each a pioneer in some aspect of the biology of dominance the authors document human brain asymmetry at gross and microscopic levels in both adults and fetuses its visualization in life by radiological methods and its manifestation in brain waves the evolutionary history of brain asymmetry over more than 300 000 years is shown in fossil skulls of humans and apes in a dramatic reversal of older beliefs asymmetry of anatomy function and chemistry has been demonstrated in many nonhuman species and experiments have shown the role of hormones and other prenatal influences in the production of asymmetry the surprising associations of non right handedness with twinning and immune disorders are discussed as well as the asymmetrical malformation of the cortex in childhood dyslexia this volume combining scholarly authority and the excitement of the birth of a new discipline will be welcomed by those to whom the implications of dominance are becoming evident neuroscientists neurologists linguists psychologists experts in learning disorders speech pathologists and by specialists in nearly every branch of biology medicine and psychology

in the years prior to publication cures for stuttering seemed to appear constantly but many were of limited value were poorly evaluated and gave only a temporary alleviation that was not transferred to daily life more responsible clinicians produced publications expounding one particular approach to therapy but less was available giving a balanced overview which was of practical help to therapists originally published in 1983 this book aimed to provide such an overview with a focus on

practical intervention rather than on theory the need for careful assessment is particularly stressed and also the need for flexibility in the choice of treatment for any one client changes in fluency are looked at in relation to the effects they might have on the person s life as a whole and factors involved in the maintenance of this change are discussed in addition adjuncts to speech therapy such as drugs hypnosis and various forms of masking are evaluated issues of the training of therapists are raised and suggestions made as to the nature of the therapeutic relationship when working with people who stutter

conceptions and practices of poetry change not only from time to time and from place to place but also from poet to poet this has never been more the case than in recent years gerald bruns s magisterial what are poets for explores typographical experiments that distribute letters randomly across a printed page sound tracks made of vocal and buccal noises and holographic poems that recompose themselves as one travels through their digital space bruns surveys one word poems found texts and book length assemblies of disconnected phrases he even includes descriptions of poems that no one could possibly write but which are no less interesting or no less poetic for all of that the purpose of the book is to illuminate this strange poetic landscape spotlighting and describing such oddities as they appear anomalies that most contemporary poetry criticism ignores naturally this breadth raises numerous philosophical questions that bruns also addresses for example whether poetry should be responsible semantically ethically politically to anything outside itself whether it can be reduced to categories distinctions and the rule of identity and whether a particular poem can seem odd or strange when everything is an anomaly perhaps our task is simply to learn like anthropologists how to inhabit such an anarchic world the poets taken up for study are among the most important and innovative in the late twentieth and early twenty first centuries john ashbery charles bernstein paul celan kenneth goldsmith lyn hejinian susan howe karen mac cormack steve mccaaffery john matthias j h prynne and tom raworth what are poets for is nothing less than a lucid detailed study of some of the most intractable writings in contemporary poetry

early experience plays a crucial role in determining the trajectory of cognitive development for

example early sensory deprivation is known to induce neural reorganization by way of adaptation to the altered sensory experience neville and bavelier s compensatory theory hypothesizes that loss of one sense may bring about a sensory enhancement in the remaining modalities sensory deprivation will however also impact the age of emergence or the speed of acquisition of cognitive abilities that depend upon sensory inputs understanding how a child s early environment shapes their cognition is not only of theoretical interest it is essential for the development of early intervention programs that address not just the early deprivation itself but also the cognitive sequelae of such deprivation the articles in this e book all address different aspects of deprivation sensory linguistic and social and explore the impacts of such deprivation on a wide range of cognitive outcomes in reading these contributions it is important to note that sensory linguistic and social deprivation are not independent factors in human experience for example a child born deaf into a hearing family is likely to experience delays in exposure to natural language with subsequent limits on their linguistic competence having an effect on social interactions and inclusion a child raised in environments where social interaction is highly limited is also likely to experience reductions in the quantity and quality of linguistic inputs future work will need to carefully examine the complex interactions between the sensory linguistic and social environments of children raised in atypical or impoverished environments

become an important tool for investigating the spatial temporal and functional brain dynamics underlying human behavior in this special issue we would like to give a broad overview of recent significant contributions that neuroscientific research has provided to one of the most practiced psychomotor skills unique to humans namely language production physiological studies in language production have not been as extensive compared to many other areas of human cognition and have just currently begun to generate important evidence for uncovering the cognitive mechanisms behind our ability to produce fast and efficient speech nonetheless these findings have already demonstrated their scientific value and interest in neuroscientific approaches for studying language production is increasing exponentially therefore we believe that a topic specially dedicated to neurocognitive advances in language production is not just in its place but even necessary rather than focusing on a specific topic the idea is to cover many of the important aspects involved in producing speech semantics word retrieval syntax phonology motor preparation and control gathered from various paradigms e g object naming word naming etc and various populations monolinguals bilinguals patients the goal is to provide readers with a comprehensive overview of the general questions being addressed in neuroscientific studies on language production where the research stands how these findings are of importance for understanding and constraining cognitive models and which future directions have to be taken to this end we will invite experts in the field who have made significant contributions in the last several years to confer an important topic of language production critically discuss neuroscientific findings on this topic relate it to the actual behavior and cognitive models and importantly though novel questions which can be derived from their results and facilitate future research in the field hereby we hope this research topic will be a source of reference both for experts as novices who wish to explore the various mental operations involved in language production from a neurocognitive point of view
