structural concrete discusses the design and analysis of reinforced and prestressed concrete structural components and structures each of the eight chapters of the book tackles a specific area of concern in structural concrete the text first deals with the serviceability and safety and then proceeds to the properties of materials and mix designs the next two chapters cover reinforced concrete beams and slabs chapter 5 discusses column and walls while chapter 6 tackles reinforced concrete frames and continuous beams and slabs the next chapter discusses design structures while the last chapter covers prestressed concrete the text will be of great use to undergraduate students of civil and structural engineering professionals whose work involves concrete technology will also find the book useful

pergamon series in analytical chemistry volume 2 basic analytical chemistry brings together numerous studies of the vast expansion in the use of classical and instrumental methods of analysis this book is composed of six chapters after providing a theoretical background of analytical chemistry this book goes on dealing with the fundamental principles of chemical equilibria in solution the subsequent chapters consider the advances in qualitative and quantitative chemical analyses these chapters present a unified view of these analyses based on the bronsted lowry theory and the donor acceptor principle these topics are followed by discussions on instrumental analysis using various methods including electrochemical optical spectroscopic and thermal methods as well as radioactive isotopes the final chapters examine the separation methods and the essential features of organic chemical analysis that are different from methods for inorganic compounds this book is of value to analytical chemists and researchers

this volume is part of the collaboration agreement between springer and the isaac society this is the first in the two volume series originating from the 2020 activities within the international scientific conference modern methods problems and applications of operator theory and harmonic analysis otha southern federal university in rostov on don russia this volume is focused on general harmonic analysis and its numerous applications the two volumes cover new trends and advances in several very important fields of mathematics developed intensively over the last decade the relevance of this topic is related to the study of complex multiparameter objects required when considering operators and objects with variable parameters

many approaches have been proposed to solve the problem of finding the optic flow field of an image sequence three major classes of optic flow computation techniques can be discriminated see for a good overview beauchemin and barron ibeauchemin19951 gradient based or differential methods phase based or frequency domain methods correlation based or area methods feature point or sparse data tracking methods in this chapter we compute the optic flow as a dense optic flow field with a multi scale differential method the method originally proposed by florack and nielsen florack1998a is known as the multiscale optic flow constrain equation mofce this is a scale space version of the well known computer vision implementation of the optic flow constraint equation as originally proposed by horn and schunck horn1981 this scale space variation as usual consists of the introduction of the aperture of the observation in the process the application to stereo has been described by maas et al maas 1995a maas 1996a of course difficulties arise when structure emerges or disappears such as with occlusion cloud formation etc then knowledge is needed about the processes and objects involved in this chapter we focus on the scale space approach to the local measurement of optic flow as we may expect the visual front end to do 17 2 motion detection with pairs of receptive fields as a biologically motivated start we begin with discussing some neurophysiological findings in the visual system with respect to motion detection
