Statistical inference is the process of using data analysis to infer properties of an underlying distribution of probability. Inferential statistical analysis infers properties of a population for example by testing hypotheses and deriving estimates. It is assumed that the observed data set is sampled from a larger population. Statistical inference is concerned with making probabilistic statements about random variables encountered in the analysis of data. Examples include means, medians, variances, and standard deviations. Inferential statistics help you come to conclusions and make predictions based on your data. When you have collected data from a sample, you can use inferential statistics to understand the larger population from which the sample is taken. Inferential statistics help you understand the process of drawing conclusions about populations or scientific truths from data. Inferential statistics describe variability, distributions, limits, and confidence intervals. They use p-values, confidence intervals, and permutation tests to make informed data analysis decisions. There are three modes of statistical inference: descriptive inference (summarizing and exploring data), inferring ideal points from roll-call votes, inferring topics from texts and speeches, inferring social networks from surveys, predictive inference (forecasting out), and experimental or observational data are modelled as the observed values of random variables to provide a framework from which inductive conclusions may be drawn about the mechanism giving rise to the data.

What is statistical inference? Statistical inference is the process of using a sample to infer the properties of a population. Statistical procedures use sample data to estimate the characteristics of the whole population from which

While descriptive statistics summarize the characteristics of a data set, inferential statistics help you come to conclusions and make predictions based on your data. When you have collected data from a sample, you can use inferential statistics to understand the larger population from which the sample is taken.
