janet abbate recounts the key players and technologies that allowed the internet to develop but her main focus is always on the social and cultural factors that influenced the internet s design and use since the late 1960s the internet has grown from a single experimental network serving a dozen sites in the united states to a network of networks linking millions of computers worldwide in inventing the internet janet abbate recounts the key players and technologies that allowed the internet to develop but her main focus is always on the social and cultural factors that influenced the internets design and use the story she unfolds is an often twisting tale of collaboration and conflict among a remarkable variety of players including government and military agencies computer scientists in academia and industry graduate students telecommunications companies standards organizations and network users the story starts with the early networking breakthroughs formulated in cold war think tanks and realized in the defense department s creation of the arpanet it ends with the emergence of the internet and its rapid and seemingly chaotic growth abbate looks at how academic and military influences and attitudes shaped both networks how the usual lines between producer and user of a technology were crossed with interesting and unique results and how later users invented their own very successful applications such as electronic mail and the world wide she concludes that such applications continue the trend of decentralized user driven development that has characterized the internet s entire history and that the key to the internet s success has been a commitment to flexibility and diversity both in technical design and in organizational culture

how to empower people and communities with user centric data ownership transparent and accountable algorithms and secure digital transaction systems data is now central to the economy government and health systems so why are data and the ai systems that interpret the data in the hands of so few people building the new economy calls for us to reinvent the ways that data and artificial intelligence are used in civic and government systems arguing that we need to think about data as a new type of capital the authors show that the use of

data trusts and distributed ledgers can empower people and communities with user centric data ownership transparent and accountable algorithms machine learning fairness principles and methodologies and secure digital transaction systems it s well known that social media generate disinformation and that mobile phone tracking apps threaten privacy but these same technologies may also enable the creation of more agile systems in which power and decision making are distributed among stakeholders rather than concentrated in a few hands offering both big ideas and detailed blueprints the authors describe such key building blocks as data cooperatives tokenized funding mechanisms and tradecoin architecture they also discuss technical issues including how to build an ecosystem of trusted data the implementation of digital currencies and interoperability and consider the evolution of computational law systems
