anxieties of interiority and dissection in early modern Spain brings the study of Europe's culture of dissection to the Iberian Peninsula presenting a neglected episode in the development of the modern concept of the self. Enrique Fernández explores the ways in which sixteenth and seventeenth century anatomical research stimulated both a sense of interiority and a fear of that interior's exposure and punishment by the early modern state. Examining works by Miguel de Cervantes, María de Zayas, Fray Luis de Granada, and Francisco de Quevedo, Fernández highlights the existence of narratives in which the author creates a surrogate self on paper, then dissects it. He argues that these texts share a fearful awareness of having a complex inner self in a country where one's interiority was under permanent threat of punitive exposure by the Inquisition or the state. A sophisticated analysis of literary, religious, and medical practice in early modern Spain, Fernández's work will interest scholars working on questions of early modern science, medicine, and body politics. Understanding anatomical structures is one thing; knowing how to dissect them is another. More effectively than any other resource, this user-friendly manual demonstrates how to successfully dissect the trunk, head, and neck, pelvis, and perineum, and upper and lower extremities. the preface it is assumed that the student has already done a course in elementary zoology including the usual vertebrate types and has also examined in more detail a mammal unless this mammal were man a number of comparisons in the book would be missed to obtain full benefit from it the student should obviously have taken the preliminary medical studies including a fair amount of human anatomy this is not meant to imply that the student of advanced zoology cannot get many useful hints and fresh points of view from its pages he undoubtedly can the types treated in a series of regional dissections are the lamprey the dogfish squalus necturus the lizard and the dog as it is intended for assistance in dissection information regarding osteology and the details of the central nervous system have been purposely omitted and conversely the muscles are treated somewhat more fully than is customary illuminating neck dissection resource presents innovative techniques and insightful fascial dissection techniques developed by several generations of renowned surgeons at la paz university hospital the book lays a foundation with in depth discussion of fascial compartmentalization of the neck the text covers the evolution of modern neck dissection from george crile in 1906 to current cutting edge procedures and details the transition from radical neck dissection to a less aggressive equally effective approach for treating lymph node metastases in head and neck cancer the relationship between functional and selective neck dissection is discussed from a pragmatic and nonconventional perspective elucidating the connection from historical anatomic and surgical standpoints the authors differentiate conceptual approaches keystones in the evolution of scientific knowledge from surgical techniques technical variations of a standard procedure designed to most effectively resolve a problem the primary goal is providing the reader with expert guidance on a full spectrum of fundamental surgical techniques key highlights sequential operative photographs of actual procedures performed by the authors complemented by stellar illustrations further understanding of techniques less radical operations discussed from american and latin perspectives
