the reference manual on scientific evidence third edition assists judges in managing cases involving complex scientific and technical evidence by describing the basic tenets of key scientific fields from which legal evidence is typically derived and by providing examples of cases in which that evidence has been used first published in 1994 by the federal judicial center the reference manual on scientific evidence has been relied upon in the legal and academic communities and is often cited by various courts and others judges faced with disputes over the admissibility of scientific and technical evidence refer to the manual to help them better understand and evaluate the relevance reliability and usefulness of the evidence being proffered the manual is not intended to tell judges what is good science and what is not instead it serves to help judges identify issues on which experts are likely to differ and to guide the inquiry of the court in seeking an informed resolution of the conflict the core of the manual consists of a series of chapters reference guides on various scientific topics each authored by an expert in that field the topics have been chosen by an oversight committee because of their complexity and frequency in litigation each chapter is intended to provide a general overview of the topic in lay terms identifying issues that will be useful

to judges and others in the legal profession they are written for a non technical audience and are not intended as exhaustive presentations of the topic rather the chapters seek to provide judges with the basic information in an area of science to allow them to have an informed conversation with the experts and attorneys this work follows the 2021 curriculum of the association for computing machinery for specialists in data sciences with the aim of producing a manual that collects notions in a simplified form facilitating a personal training path starting from specialized skills in computer science or mathematics or statistics it has a bibliography with links to quality material but freely usable for your own training and contextual practical exercises third of a series of books it first summarizes the standard crisp dm working methodology used in this work and in data science projects since this text uses orange for the application aspects it describes its installation and widgets then it considers the concept of model its life cycle and the relationship with measures and metrics the measures of localization dispersion asymmetry correlation similarity distance are then described the test and score metrics used in machine learning those relating to texts and documents the association metrics between items in a shopping cart the relationship between objects similarity between sets and between graphs similarity between time series are considered as a preliminary activity to the modeling phase the exploration data analysis is deepened in terms of questions process techniques and types of problems for each type of problem the recommended graphs the methods of interpreting the results and their implementation in orange are considered the text is accompanied by supporting material
