the book has evolved out of my teaching of topology at the postgraduate level since 1990 after my retirement in 2018 i left the boundaries of the prescribed syllabus by adding material to the notes limit of a function is seldom defined in a course of topology i have given a glimpse of definition of limit of function a function on natural numbers is a sequence and on a directed set is a net however depending upon the cardinality of the directed set we define different types of nets this could be easily linked with the cardinal functions in a topology i am planning to incorporate the same in the future editions the present book includes a brief history of topology basic set theory basic concepts in topology like base subbase neighbourhoods and local base subspaces closed sets closure interior and limit points continuous functions the book also deals with the order topology categorial methods metric spaces nets and filters separation and countability axioms compact spaces connected and path connected spaces and uniform spaces

for three terminals was first studied by fermat 1601 1665 fermat proposed the problem of finding a point to minimize the total distance from it to three terminals in the euclidean plane the direct generalization is to find a point to minimize the total distance from it to n terminals which is still called the fermat problem today the steiner minimum tree problem is an indirect generalization schreiber in 1986 found that this generalization i e the steiner mini mum tree was first proposed by gauss

written by one of the subject s foremost experts this book focuses on the central developments and modern methods of the advanced theory of abelian groups while remaining accessible as an introduction and reference to the non specialist it provides a coherent source for results scattered throughout the research literature with lots of new proofs the presentation highlights major trends that have radically changed the modern character of the subject in particular the use of homological methods in the structure theory of various classes of abelian groups and the use of advanced set theoretical methods in the study of un decidability problems the treatment of the latter trend includes shelah s seminal work on the un decidability in zfc of whitehead s problem while the treatment of the former trend includes an extensive but non exhaustive study of p groups torsion free groups mixed groups and important classes of groups arising from ring theory to prepare the reader to tackle these topics the book reviews the fundamentals of abelian group theory and provides some background material from category theory set theory topology and homological algebra an abundance of exercises are included to test the reader s comprehension and to explore noteworthy extensions and related sidelines of the main topics a list of open problems and questions in each chapter invite the reader to take an active part in the subject s further development

the purpose of this collection is to guide the non specialist through the basic theory of various generalizations of topology starting with clear motivations for their introduction structures considered include closure spaces convergence spaces proximity spaces quasi uniform spaces merotopic spaces nearness and filter spaces semi uniform convergence spaces and approach spaces each chapter is self contained and accessible to the graduate student and focuses on motivations to introduce the generalization of topologies considered presenting examples where desirable properties are not present in the realm of topologies and the problem is remedied in the more general context then enough material will be covered to prepare the reader for more advanced papers on the topic while category theory is not the focus of the book it is a convenient language to study these structures and while kept as a tool rather than an object of study will be used throughout the book for this reason the book contains an introductory chapter on categorical topology
