with a focus on practical acute pain management in adults in the hospital setting this book provides health professionals with simple and practical information to help them manage patients with acute pain safely and effectively combines evidence based information with practical guidelines and protocols covers the pharmacology of opioids local anesthetics and nonopioid and adjuvant analgesic agents discusses management of acute pain in both surgical and nonsurgical acute pain settings including in patients with spinal cord or burns injuries and selected medical illnesses includes evidence based information about management of acute pain in some specific patient groups including the older patient opioid tolerant patients and those with addiction disorders pregnant or lactating patients and patients with obstructive sleep apnea or who have renal or hepatic impairment considers the role of acute pain management in the context of the current opioid epidemic and identifies possible strategies to minimise the risks this resource will be helpful to a variety of professionals in assessing and managing acute pain

Patients' Evaluation of Patient Controlled Analgesia After Surgery

2001

pain is a pervasive symptom present in multiple areas of medicine it is imperative that physicians not only evaluate and diagnose the source of pain but that they also recognize how to manage the actual pain symptoms with effective treatment handbook of acute pain management is an essential reference for professionals to enhance their knowledge

Investigation of Patient-controlled Analgesia for the Treatment of Postoperative Pain in Children

1996

this textbook is written as a comprehensive overview of acute pain management

it is designed to guide clinicians through an impressive array of different options available to them and to patients there has been a flurry of interest in the extent to which acute pain can become chronic pain and how we might reduce the incidence of such chronicity this overview covers a wide range of treatments for pain management including the anatomy of pain pathways the pathophysiology of severe pain pain assessment therapeutic guidelines analgesic options organization of pain services and the role of anesthesiologists surgeons pharmacists and nurses in providing optimal care it also discusses the use of patient controlled analgesia and how this may or may not be effective and useful

Patient-controlled Analgesia in the Postoperative Period

1995

this guide to the safe and effective management of conventional forms of analgesia is supplemented with checklists flow charts and key points that can be referred to during treatment of a patient this edition has been extensively revised and updated

Intravenous Patient-Controlled Analgesia for Acute Pain Management

mastering clinical skills are computer assisted tutorials on clinical procedures nurses encounter in everyday practice the programs concentrate on concepts decision making trouble shooting and handling emergencies when appropriate the programs also examine traditions which have been disproved through clinical research although they may still be practiced by some health care professionals each program consists of seven learning modules or sections plus a mastery test windows compatible

Personality Characteristics of Patients and the Effectiveness of Patient Controlled Analgesia

1991

this book is a comprehensive very specific clinical guide for health care providers dimensions of critical care nursing this well written and well organized book is a

much needed middle ground resource between oversimplified introductions to pain management and a thick textbook clinical nurse specialist the compact clinical guide to acute pain management provides an excellent overview of the process of pain management for adult patients in any setting critical care nurse this book provides much needed guidelines that are presented in an easy to use systematic format for quick access to core concepts on acute pain management it is designed to help busy practitioners accurately assess pain in a variety of patient populations and select patient appropriate medications and interventions to achieve optimal pain management for adult patients intended for use in primary care internal medicine and acute and long term care settings this book covers the topics of acute pain assessment both pharmacologic and nonpharmacologic treatment options current information from national guidelines along with regional anesthesia techniques patient controlled analgesia and epidural pain management key features offers important new perspective on combination use of pain scales to accurately predict individual pain management needs for more customized and effective management delivers information on how to treat acute pain in hospitalized patients who also suffer from chronic pain and substance abuse offers new information on opioid polymorphisms and their surprising effect on pain medication effectiveness includes a special chapter on managing pain in difficult to treat patient populations this is an essential reference for primary care providers in clinics hospitals specialty care and critical care to assess pain in general populations and provide tips for performing pain assessment on patients with acute pain

Investigation of Patient-controlled Analgesia for the Treatment of Postoperative Pain in Children

largely reorganised and much expanded in this second edition practice and procedures brings together in a single volume general methods of pain assessment and presents the wide range of therapies that can be provided by a range of health care disciplines authored by a multidisciplinary team of experts chapters can stand alone for readers looking

Cost Effectiveness of Intravenous Patient Controlled Analgesia Versus Intrathecal Morphine for Post-operative Pain After Caesarean Section

2005

labour pain is considered as severe pain epidural analgesia is the most effective and a preferred method of labour analgesia remifentanyl patient controlled analgesia pca is an alternative to epidural analgesia when not available not

desired or contraindicated remifentanyl a synthetic opioid is associated with hypoventilation and respiratory depression but the frequency of serious maternal and neonatal adverse events is unknown this thesis provides information to make a thorough decision on the place of remifentanyl pca as an appropriate method for pain relief during labour we conducted a randomised controlled equivalence trial in which we compared satisfaction with pain relief between epidural analgesia and remifentanyl pca in secondary analyses we studied the association between fear of childbirth and pharmacological pain relief and whether we could identify women with a request for pain relief who would be as satisfied with remifentanyl pca compared to epidural analgesia afterwards we assessed the current use of remifentanyl pca and the number of serious adverse events sae attributed to remifentanyl pca in the netherlands we concluded that remifentanyl pca is used on a large scale in the netherlands despite lower satisfaction with pain relief compared to epidural analgesia although we showed that the risk for an sae is extremely low the adherence to strict maternal monitoring and attendance of trained healthcare providers are essential to safely use remifentanyl pca to guarantee safe administration of remifentanyl pca compliance to the standard operating procedure and maternal monitoring methods have to be improved if these conditions are met remifentanyl pca could be an appropriate method for labour analgesia
