this volume offers theoretically informed surveys of topics that have figured prominently in morphosyntactic and syntactic research into romance languages and dialects we define syntax as being the linguistic component that assembles linguistic units such as roots or functional morphemes into grammatical sentences and morphosyntax as being an umbrella term for all morphological relations between these linguistic units which either trigger morphological marking e g explicit case morphemes or are related to ordering issues e g subjects precede finite verbs whenever there is number agreement between them all 24 chapters adopt a comparative perspective on these two fields of research highlighting cross linguistic grammatical similarities and differences within the romance language family in addition many chapters address issues related to variation observable within individual romance languages and grammatical change from latin to romance

the worldwide use of building envelopes in steel and glass is one of the characteristic features of modern architecture many of these pre and post war buildings are now suffering severe defects in the building fabric which necessitate measures to preserve the buildings in this endeavor aspects of architectural design building physics and the preservation of historic buildings play a key role using a selection of 20 iconic buildings in europe and the usa the book documents the current technological status of the three most common strategies used today restoration rehabilitation and replacement the buildings include fallingwater house by frank lloyd wright farnsworth house by ludwig mies van der rohe fagus factory and bauhaus building by walter gropius

glass is a popular cladding material for modern buildings the trend for steel framed glass clad buildings instead of those using traditional materials such as brick and concrete has inherent problems these include for example the performance of architectural glass in extreme climatic events such as windstorms and heavy snow loads and also during earthquakes this book reviews the state of the art in glass and glazing technology to resist failure due to these natural events building code seismic requirements for architectural glass in the united states are considered first of all followed by a chapter on glazing and curtain wall systems to resist earthquakes the next two chapters discuss snow loads on building envelopes and glazing systems and types and design of glazing systems to resist snow loads wind pressures and the impact of wind borne debris are then considered in the next group of chapters which also review special types of glazing systems to resist windstorms a final chapter reviews test methods for the performance of glazing systems during earthquakes and extreme climatic events with its distinguished editor and team of contributors architectural glass to resist seismic and extreme climatic events is an essential resource for architects structural civil and architectural engineers researchers and those involved in designing and specifying building glazing and cladding materials in areas where severe windstorms snow and earthquakes are a threat considers the state of the art in glass and glazing technology to resist failure due to extreme climatic events reviews specific building techniques and test methods to enhance glazing performance during snow storms wind storms and earthquakes

treatise written 400 b c e in his book on airs waters and places hippocrates described diseases as associated with environmental conditions whoever wishes to investigate medicine properly should proceed thus in the first place to consider the seasons of the year and what effects each of them produces for they are not at all alike but differ much from themselves in regard to their changes then the winds the hot and the cold especially such as are common to all countries and then such as are peculiar to each locality we must also consider the qualities of the waters for as they differ from one another in taste and weight so also do they differ much in their qualities in the same manner when one comes into a city to which he is a stranger he ought to consider its situation how it lies as to the winds and the rising of the sun for its influence is not the same whether it lies to the north or the south to the rising or to the setting sun there has been a greater emphasis in the last four decades on understanding environmental factors which affect human health after united nations established intergovernmental panel on climate change ipcc in 1988 aimed at to evaluate research on changing environmental condition particularly climate change and its impacts on human wellbeing including human health as consequences of extreme heat waves conditions sea level rise forced migration air pollution droughts and wildfires from these studies risk levels of vulnerable populations and regions can be assessed and level of resilience of healthcare infrastructure that may be used in environmental health policy and equity of these countries

the volume presents a collaboration between internationally recognized experts on anti optimization and structural optimization and summarizes various novel ideas methodologies and results studied over 20 years the book vividly demonstrates how the concept of uncertainty should be incorporated in a rigorous manner during the process of designing real world structures the necessity of anti optimization approach is first demonstrated then the anti optimization techniques are applied to static dynamic and buckling problems thus covering the broadest possible set of applications finally anti optimization is fully utilized by a combination of structural optimization to produce the optimal design considering the worst case scenario this is currently the only book that covers the combination of optimization and anti optimization it shows how various optimization techniques are used in the novel anti optimization technique and how the structural optimization can be exponentially enhanced by incorporating the concept of worst case scenario thereby increasing the safety of the structures designed in various fields of engineering
