first published in 1996 this collection of essays by distinguished computer scientists celebrates the achievements of research and speculates about the unsolved problems in computer science that require future investigation since the subject stretches from technology in the field through engineering design to foundations in mathematics there is a wide variety of concerns and approaches among the authors the book s purpose is to show that long term research in computer science is crucial and that it must not be driven solely by commercial considerations the authors do not shirk the difficult aspects of their topics but try to expose them in the simplest terms possible without diluting them in order that the reader can understand the issues involved thus the book also represents a broad overview of much of the state of knowledge and future expectations of computer science illustrating that it is much more than a technology and it is a fully fledged and growing intellectual discipline with its own engineering principles and its own scientific concepts and models it will be stimulating reading because it represents the views of prominent authorities who have had a significant impact on the direction of innovation research and development in computer science

this monograph on security in computing systems challenges approaches and solutions aims at introducing surveying and assessing the fundamentals of security with respect to computing here computing refers to all activities which individuals or groups directly or indirectly perform by means of computing systems i e by means of computers and networks of them built on telecommunication we all are such individuals whether enthusiastic or just bowed to the inevitable so as part of the information society we are challenged to maintain our values to pursue our goals and to enforce our interests by consciously designing a global information infrastructure on a large scale as well as by appropriately configuring our personal computers on a small scale as a result we hope to achieve secure computing roughly speaking computer assisted activities of individuals and computer mediated cooperation between individuals should happen as required by each party involved and nothing else which might be harmful to any party should occur the notion of security circumscribes many aspects ranging from human qualities to technical enforcement first of all in considering the explicit security requirements of users administrators and other persons concerned we hope that usually all persons will follow the stated rules but we also have to face the possibility that some persons might deviate from the wanted behavior whether accidentally or maliciously
