this is the third edition of the pioneering work that has become the standard text in the field the first edition was one of the earliest to establish that the newly developing international law of human rights could be set down as any other branch of international law it also incorporates the complementary fields of international humanitarian law and international criminal law while addressing the problems associated with their interaction with human rights law the book is more than a descriptive analysis of the field it acknowledges areas of unclarity or where developments may be embryonic solutions are offered recent developments have confirmed the value of solutions proposed in this edition and the previous one central to most of the chapters is the human rights norm of most salience in the treatment of prisoners namely the prohibition of torture and cruel inhuman or degrading treatment or punishment the early chapters focus on the period of first detention when detainees are most at risk of having information or confessions however unreliable extracted by unlawful means voices contemplating the legitimacy of such treatment to combat terrorism have been heard in the wake of the atrocities of 11 september 2001 the book finds that the evidence clearly suggests that the absolute prohibition of such treatment remains firm other chapters deal with problems of poor prison conditions and of certain extraordinary penalties notably corporal and capital punishment a chapter explores ethical codes for members of professions capable of inflicting or preventing the prohibited behaviour police and medical and legal professionals chapters are also devoted to the extreme practice of enforced disappearance and the contribution of the new convention on this phenomenon as well as to extra legal executions alcohol use disorder and is a complex disorder with multiple pathophysiological processes contributing to the initiation progression and development of the disease state and is a chronic relapsing disease with escalation of alcohol intake over time in repeated cycles of tolerance abstinence and relapse and hence it is very difficult to treat there are only a few currently available treatments with narrow efficacy and variable patient response thus it is important to find new more effective medications to increase the number of patients who can benefit from pharmacological treatment of aud the research presented in this thesis work focuses on the critical involvement of central neuropeptides in alcohol related behaviors the overall aim was to evaluate the nociceptin orphanin fg nop receptor the neuropeptide y npy y2 receptor and the melanin concentrating hormone mch receptor 1 as novel and potential pharmacological treatment targets for aud by testing the nop receptor agonist sr 8993 the npy y2 receptor antagonist cym 9840 and the mch1 receptor antagonist gw803430 in established animal models in the first study paper i the novel and selective nop agonist sr 8993 was assessed in rat models of motivation to obtain alcohol and relapse to alcohol seeking behavior using the operant self administration sa paradigm firstly treatment with sr 8993 1 mg kg showed a mildly anxiolytic effect and reversed acute alcohol withdrawal induced hangover anxiety in the elevated plus maze epm next it potently attenuated alcohol sa and motivation to obtain alcohol in the progressive ratio responding prr and reduced both alcohol cue induced and yohimbine stress induced reinstatement of alcohol seeking without affecting the pharmacology and metabolism of alcohol nor other control behaviors to extend these findings sr 8993 was evaluated in escalated alcohol intake in rats treatment with sr 8993 significantly suppressed alcohol intake and preference in rats that were trained to consume high amounts of alcohol in the two bottle free choice intermittent access ia paradigm sr 8993 also blocked operant sa of alcohol in rats that showed robust escalation in operant alcohol sa following chronic ia exposure to alcohol in the second study paper ii sr 8993 was further evaluated in a model for escalated alcohol intake induced by long term is exposure peter the great his life and

to alcohol the effect of previous experience on operant alcohol sa on two bottle free choice preference drinking was evaluated and sensitivity to treatment with sr 8993 was tested in rats selected for escalated and non escalated alcohol seeking behavior we found that rats exposed to the combined sa ia paradigm showed greater sensitivity to sr 8993 treatment in addition acute escalation of alcohol sa after a three week period of abstinence was completely abolished by pretreatment with sr 8993 in the third study paper iii the effects of the novel small molecule npy y2 antagonist cym 9840 were tested in operant alcohol sa prr which is a model for motivation to work for alcohol and reinstatement of alcohol seeking behavior treatment with cym 9840 10 mg kg potently attenuated alcohol sa progressive ratio responding and stress induced reinstatement using vohimbine as the stressor while alcohol cue induced reinstatement was unaffected moreover a range of control behaviors including taste sensitivity locomotor and pharmacological sensitivity to the sedative effects of alcohol remained unaffected by cym 9840 pretreatment indicating that its effects are specific to the rewarding and motivational aspects of alcohol intake and related behaviors cym 9840 also reversed acute alcohol withdrawal induced hangover anxiety measured in the epm and reduced alcohol intake in the 4 hour limited access two bottle free choice preference drinking model finally in the fourth study paper iv the selective mch1 r antagonist gw803430 was tested in rat models of escalated alcohol intake pretreatment with gw803430 effective at 10 30 mg kg dose dependently reduced alcohol and food intake in rats that consumed high amounts of alcohol during ia while it only decreased food intake in rats that consumed low amounts of alcohol during ia likely due to a floor effect upon protracted abstinence following ia gw803430 significantly reduced operant alcohol sa and this was associated with adaptations in mch and mch1 r gene expression in contrast gw803430 did not affect escalated alcohol sa induced by chronic alcohol vapor exposure and this was accompanied by no change in mch or mch1 r gene expression overall these results suggest that the mch1 r antagonist affects alcohol intake through regulation of both motivation for caloric intake and the rewarding properties of alcohol in conclusion our results suggest critical roles for these central neuropeptides in the regulation of anxiety and of alcohol reward making them potential pharmacological targets in the treatment of aud the australian guidelines for the treatment of alcohol problems have been periodically developed over the past 25 years in 1993 the first version of these guidelines titled an outline for the management of alcohol problems quality assurance in the treatment of drug dependence project was published mattick jarvis 1993 the australian government commissioned an update a decade later shand et al 2003 and a further edition in 2009 to integrate the guidelines with the australian guidelines to reduce health risks from drinking alcohol national health and medical research council nhmrc 2009 haber et al 2009 the present version of the guidelines was also commissioned by the commonwealth of australia to remain current and integrated with the updated nhmrc consumption guidelines 2020 in order to ensure that guidelines remain relevant the next set of guidelines should be updated in 2025 consistent with nhmrc recommendation that guidelines be updated every five years these guidelines aim to provide up to date evidence based information to clinicians on available treatments for people with alcohol problems and are largely directed towards individual clinicians in practice such as primary care physicians general practitioners nursing staff specialist medical practitioners psychologists and other counsellors and other health professionals some chapters highlight service or system level issues that impact on clinicians and their patients these include recommendations concerning aboriginal and torres strait islander peoples culturally and linguistically diverse groups stigma and beter the great his life and

this is the third edition of the pioneering work that has become the standard text in the field the first edition was one of the earliest to establish that the newly developing international law of human rights could be set down as any other branch of international law it also incorporates the complementary fields of international humanitarian law and international criminal law while addressing the problems associated with their interaction with human rights law the book is more than a descriptive analysis of the field it acknowledges areas of unclarity or where developments may be embryonic solutions are offered recent developments have confirmed the value of solutions proposed in this edition and the previous one central to most of the chapters is the human rights norm of most salience in the treatment of prisoners namely the prohibition of torture and cruel inhuman or degrading treatment or punishment the early chapters focus on the period of first detention when detainees are most at risk of having information or confessions however unreliable extracted by unlawful means voices contemplating the legitimacy of such treatment to combat terrorism have been heard in the wake of the atrocities of 11 september 2001 the book finds that the evidence clearly suggests that the absolute prohibition of such treatment remains firm other chapters deal with problems of poor prison conditions and of certain extraordinary penalties notably corporal and capital punishment a chapter explores ethical codes for members of professions capable of inflicting or preventing the prohibited behaviour police and medical and legal professionals chapters are also devoted to the extreme practice of enforced disappearance and the contribution of the new convention on this phenomenon as well as to extra legal executions

alcohol use disorder aud is a complex disorder with multiple pathophysiological processes contributing to the initiation progression and development of the disease state aud is a chronic relapsing disease with escalation of alcohol intake over time in repeated cycles of tolerance abstinence and relapse and hence it is very difficult to treat there are only a few currently available treatments with narrow efficacy and variable patient response thus it is important to find new more effective medications to increase the number of patients who can benefit from pharmacological treatment of aud the research presented in this thesis work focuses on the critical involvement of central neuropeptides in alcohol related behaviors the overall aim was to evaluate the nociceptin orphanin fq nop receptor the neuropeptide y npy y2 receptor and the melanin concentrating hormone mch receptor 1 as novel and potential pharmacological treatment targets for aud by testing the nop receptor agonist sr 8993 the npy y2 receptor antagonist cym 9840 and the mch1 receptor antagonist gw803430 in established animal models in the first study paper i the novel and selective nop agonist sr 8993 was assessed in rat models of motivation to obtain alcohol and relapse to alcohol seeking behavior using the operant self administration sa paradigm firstly treatment with sr 8993 1 mg kg showed a mildly anxiolytic effect and reversed acute alcohol withdrawal induced hangover anxiety in the elevated plus maze epm next it potently attenuated alcohol sa and motivation to obtain alcohol in the progressive ratio responding

prr and reduced both alcohol cue induced and yohimbine stress induced reinstatement of alcohol seeking without affecting the pharmacology and metabolism of alcohol nor other control behaviors to extend these findings sr 8993 was evaluated in escalated alcohol intake in rats treatment with sr 8993 significantly suppressed alcohol intake and preference in rats that were trained to consume high amounts of alcohol in the two bottle free choice intermittent access ia paradigm sr 8993 also blocked operant sa of alcohol in rats that showed robust escalation in operant alcohol sa following chronic ia exposure to alcohol in the second study paper ii sr 8993 was further evaluated in a model for escalated alcohol intake induced by long term ia exposure to alcohol the effect of previous experience on operant alcohol sa on two bottle free choice preference drinking was evaluated and sensitivity to treatment with sr 8993 was tested in rats selected for escalated and non escalated alcohol seeking behavior we found that rats exposed to the combined sa ia paradigm showed greater sensitivity to sr 8993 treatment in addition acute escalation of alcohol sa after a three week period of abstinence was completely abolished by pretreatment with sr 8993 in the third study paper iii the effects of the novel small molecule npy y2 antagonist cym 9840 were tested in operant alcohol sa prr which is a model for motivation to work for alcohol and reinstatement of alcohol seeking behavior treatment with cym 9840 10 mg kg potently attenuated alcohol sa progressive ratio responding and stress induced reinstatement using vohimbine as the stressor while alcohol cue induced reinstatement was unaffected moreover a range of control behaviors including taste sensitivity locomotor and pharmacological sensitivity to the sedative effects of alcohol remained unaffected by cym 9840 pretreatment indicating that its effects are specific to the rewarding and motivational aspects of alcohol intake and related behaviors cym 9840 also reversed acute alcohol withdrawal induced hangover anxiety measured in the epm and reduced alcohol intake in the 4 hour limited access two bottle free choice preference drinking model finally in the fourth study paper iv the selective mch1 r antagonist gw803430 was tested in rat models of escalated alcohol intake pretreatment with gw803430 effective at 10 30 mg kg dose dependently reduced alcohol and food intake in rats that consumed high amounts of alcohol during ia while it only decreased food intake in rats that consumed low amounts of alcohol during ia likely due to a floor effect upon protracted abstinence following ia gw803430 significantly reduced operant alcohol sa and this was associated with adaptations in mch and mch1 r gene expression in contrast gw803430 did not affect escalated alcohol sa induced by chronic alcohol vapor exposure and this was accompanied by no change in mch or mch1 r gene expression overall these results suggest that the mch1 r antagonist affects alcohol intake through regulation of both motivation for caloric intake and the rewarding properties of alcohol in conclusion our results suggest critical roles for these central neuropeptides in the regulation of anxiety and of alcohol reward making them potential pharmacological targets in the treatment of aud

the australian guidelines for the treatment of alcohol problems have been periodically developed over the past 25 years in 1993 the first version of these guidelines titled an outline for the management of alcohol problems quality assurance in the treatment of drug dependence project was published mattick jarvis 1993 the australian government

commissioned an update a decade later shand et al 2003 and a further edition in 2009 to integrate the guidelines with the australian guidelines to reduce health risks from drinking alcohol national health and medical research council nhmrc 2009 haber et al 2009 the present version of the guidelines was also commissioned by the commonwealth of australia to remain current and integrated with the updated nhmrc consumption guidelines 2020 in order to ensure that guidelines remain relevant the next set of guidelines should be updated in 2025 consistent with nhmrc recommendation that guidelines be updated every five years these guidelines aim to provide up to date evidence based information to clinicians on available treatments for people with alcohol problems and are largely directed towards individual clinicians in practice such as primary care physicians general practitioners nursing staff specialist medical practitioners psychologists and other counsellors and other health professionals some chapters highlight service or system level issues that impact on clinicians and their patients these include recommendations concerning aboriginal and torres strait islander peoples culturally and linguistically diverse groups stigma and discrimination elsewhere organisation capacity is implied such as medical resources for withdrawal management where recommendations indicate use of medications as all forms of treatment will not be readily available or suitable for all populations or settings these guidelines may require interpretation and adaptation

this book focuses on industrial wastes that either join the streams or other natural water bodies directly or are emptied into the municipal sewers and their characteristics vary widely depending on the source of production and the raw material used by the industry even during pre industrial industrial period and prospect of wastewater treatment for water resource conservation the treatment of industrial wastewater can be done in part or as a whole either by the biological or chemical processes advanced treatment methods like membrane separation ultra filtration techniques and adsorption are elaborated it would emphasize and facilitate a greater understanding of all existing available research i e theoretical methodological well established and validated empirical work associated with the environment and climate change aspects

treatment marshes for runoff and polishing represents the most comprehensive and up date date resource for the design construction and operation of marsh treatment systems this new edition represents a complete rewrite of the surface flow sections of previous editions of treatment wetlands it is based on the performance hundreds of treatment marshes over the past 40 years treatment marshes focuses on urban and agricultural runoff river and lake water improvement and highly treated municipal effluents new information from the past dozen years is used to improve data interpretation and design concepts topics included in this book are diversity of marsh vegetation analyses of the human use of treatment marshes new concepts of underground processes and functions spectrum of marsh values spanning

mitigation restoration enhancement and water quality improvement improved methods for calculation of evapotranspiration and wetland water temperatures hydraulics of surface and subsurface flows in marshes analysis of long track records for deterministic and probabilistic behavior consideration of integrated microbial and vegetative contaminant removals via mass balances uptake and emission of gases performance of urban and agricultural wetlands design procedures for urban and agricultural wetlands reduction of trace metals pesticides pharmaceuticals endocrine disruptors and trace organics updated capital and o m economics and valuation of ancillary benefits an updated list of over 1900 references

An Introduction to Industrial Water Treatment 2018-01-01

stroke is thought to be the second biggest killer worldwide and is responsible for over 5 million deaths per year several strategies have been developed to enhance treatment of stroke patients multimodal neuroimaging allows physicians to diagnose and evaluate not only the ischemic core but also the vessel pattern and collateral status stroke treatment involves extensive intravenous drug administration several new drugs with long lasting efficacy are now being tested in randomized clinical trials in this context endovascular treatment is a promising avenue that allows physicians to treat patients in extended time windows especially patients in whom intravenous rtpa has failed a new era has emerged with new devices called stent retrievers and aspiration techniques which have demonstrated higher rates of recanalization and clear superiority over previous devices employed in rcts the third volume of frontiers in neurosurgery presents updated information on ischemic stroke treatment the volume comprehensively covers the epidemiology physiology diagnosis and treatment modalities of stroke readers will also find key information on diagnosing and treating rare and lesser known causes of stroke as well as notes about new devices and medical procedures to combat ischemic stroke this volume is a useful resource for neurosurgery specialists as well as nurses physiotherapists and caregivers

this practical and easily navigable book covers the gamut of issues that need to be understood to provide excellent medical care for those with adhd outside of mental health professionals those who most often treat adhd are primary care providers such as family practitioners pediatricians nurse practitioners physician assistants and school personnel based on clinical conversations with patients with adhd and their families this book provides concise useful up to date information of a practical nature for most if not all of the problems associated conditions and questions that arise when an individual has concerns about adhd treatments discussed include a thorough review of medication options with expected results and side effects as well as other recommended treatments including a variety of therapeutic modalities and a review of less commonly considered but important interventions regarding general health sleep diet exercise and school interventions readers will gain an understanding of what adhd is practical reviews of the literature that will help in discussion with patients and their families the importance of intervention and all the resources and options available to provide the best treatment strategies for anyone who has adhd as well
