**Electrical Diseases of the Heart** 2013 the interplay between the careful analysis of clinical electrocardiograms and results from animal experiments have in the past 60 years resulted in provocative and brilliant concepts on the mechanisms of cardiac arrhythmias in man many of the animal experiments however were done on open chested dogs with cut cardiac nerves and under the influence of pharmaca it is doubtful therefore whether these results can be transferred without reservation to the human situation the introduction of electrical stimulation of the heart in clinical cardiology has opened new ways to study some aspects of cardiac arrhythmias directly in the unaesthetized patient this study reports observations on patients who were admitted to the university department of cardiology wilhelmina gasthuis amsterdam for

the evaluation and treatment of tachycardias electrically induced premature beats were used in an effort to elucidate the origin and mechanism of these tachycardias the first chapter is on classification and diagnosis of tachycardias with special emphasis on our current knowledge of the differential diagnosis between supraventricular tachycardias with aberrant conduction and ventricular tachycardias this is followed by theoretical considerations on tachycardias especially in relation to the methods used in this study after an outline of these methods the results of our studies in patients with atrial flutter a v junctional tachycardias and tachycardias related to the pre excitation syndrome are reported a discussion on the value of electrical stimulation for the treatment of tachycardias is followed by a summary of our results

**Biomedical Applications of Microfluidic Devices** 2020-11-12 less than 20 years ago the use of cannabis and the cannabinoids was still considered a minor somewhat quaint area of research a few groups were active in the field but it was already being viewed as stagnating the chemistry of cannabis  $\Delta^9$  was well known tetrahydrocannabinol (THC) identified in 1964 being the only major psychoactive constituent and cannabidiol (CBD) which is not psychoactive possibly contributing to some of the effects these cannabinoids and several synthetic analogs had been thoroughly investigated for their pharmacological effects their mode of action was considered to be non-specific the reasons for this assumption were both technical and conceptual on the technical side it had been shown that THC was active in both enantiomeric forms though with a different level of potency and this observation was incompatible with action on biological substrates a receptor an enzyme an ion channel which react with a single stereoisomer only the conceptual problem related to the activity this had been pointed out by several highly regarded research groups that had shown that many of the effects seen with cannabinoids were related to those of biologically active lipophiles and that many of the effects of the particularly chronic ones were comparable to those seen with anaesthetics and solvents
