it is claimed in this book that expectations should not necessarily be treated as unobservable variables and that there is much to be learned from survey data a unique data set is examined the output of surveys conducted twice a year since 1952 among informed italian businessmen and economic experts the predictive accuracy rationality and determinants of inflation expectations are investigated following an extensive analysis of measurement issues the estimate of inflation expectations are evaluated for both wholesale and consumer price changes comparing them with those held by respondents to other surveys for different countries and with the forecasts generated by alternative predictors of the inflation process the expectations considered in the study are shown to be remarkably accurate anticipating all major price changes even if during the years of high and rising inflation which have followed the first oil crisis they appear to underestimate on a number of occasions the inflation rates actually experienced as the alternative predictors also do an accurate testing of the rational expectations hypothesis is conducted rejecting it over the entire sample period but not for the period of mild but variable inflation which preceded the first oil crises it is shown that a mixed adaptive regressive model with both error learning and return to normality components adapts very well to the data considered in this study and that inflation expectations are also influenced by an uncertainty component which affects the adaptive coefficient furthermore regression towards normality is slowed down when industrial capacity is utilized above normal and vice versa many other issues such as the dispersion of individual answers the problems of aggregation and measurement error are also considered and an extensive bibliography of other works where use is made of direct information on expectations is included

creativity the highest level of human wisdom has become an increasingly important concept in different fields of psychological enquiry particularly because it is portrayed as contributing to many aspects of society including personal development economic prosperity and technological advancement however although considerable research attention from a wide range of disciplinary backgrounds has focused on trying to understand creativity the specific nature of creativity its theoretical underpinnings and cognitive mechanisms remain unclear not least when it comes to the understanding of creativity at the individual level and creativity at the collective level on the one hand there are crucial distinctions between individual and collective creativity on the other hand the process of being creative involves not only independent or individual efforts but also interdependent or collective efforts understanding these differences and interrelationships is crucially important in studies of creativity in this research topic we bring together research from a wide variety of cognitive and psychological approaches and perspectives in order to provide a comprehensive and in depth understanding of creativity at both the individual and collective levels furthermore cognitive mechanisms in the creativity process are unavoidably affected by sociocultural factors and these mechanisms look different across cultures particularly between eastern cultures and western cultures two worlds that often imply dramatically dissimilar values and perspectives despite the fact that many studies have compared and contrasted these two cultures in various respects little research has focused on the specific topic of cultural variation in creative cognition in addition very few studies have examined the differences in the cognitive mechanisms underpinning the cultural variations that can be observed at a surface level this research topic aims to fill this gap in the literature and examine the cognitive processes and mechanisms in the creativity process at both individual and collective levels across different cultures by using theoretical and empirical evidence

the state of the art of electroencephalography is in a condition of flux because of the recent technological advances in the methods for processing neuroelectric data one major motivating influence for accelerating these recent advances is the increasing emphasis on manned space flight programs how competent is man during orbital flight the purpose of this report was to seek an answer to this question since competency is defined as functional adequacy some clue to this adequacy may be found in monitoring the nervous system particularly the electrical activity of the brain a search for a possible answer to the above question was made therefore in the field of electroencephalography unfortunately no electroencephalograms of our astronauts have been recorded during flight this report contains the opinions of scientists recognized generally for their contributions to the field of neurophysiology and psychiatry and is an attempt at answering the above question
