castration of domesticated animals a d104 book for stock owners students of agriculture and veterinarians in writing the present volume it has been the aim of the authors to present the material in such a manner that it may readily be grasped by the lay mind and those without previous training in anatomy or surgical technique in view of the fact that a correct expression of the authors opinion demands the use of certain professional and technical terms though these have been eliminated in so far as possible it has been deemed advisable to include short chapters on the surgical anatomy of the parts supplemented by photographs and hand drawings in order to obtain a correct idea regarding the subject of castration it is desirable though not absolutely essential that all the chapters be perused and the illustrations studied as there is considerable correlation between the various parts of the text the admonition that there is no short cut to knowledge is well to bear in mind about confusion between the basic emotional systems of fear and separation distress panic methods used for temperament tests can alter results such as how tightly an animal is restrained in a squeeze chute during temperament evaluation animals with a more reactive fearful temperament will exhibit greater agitated behavioral reactions when suddenly confronted with novel objects animals can be habituated to new things but learning is very specific habituation to one type of strange object may not transfer to other types of objects animals with smaller diameter leg bones and slender bodies may be more reactive fearful facial hair whorl position is related to a vigilant temperament and it may be more evident in populations with more diverse genetic backgrounds this work has been selected by scholars
