electromagnetism for engineers vol i electrostatics is a comprehensive introduction to the fundamental principles of electromagnetism making it an indispensable source for a wide range of readers this volume covers the essential concepts of electrostatics including coulomb s law electric fields gauss s law and vector mathematics which forms a foundational tool throughout the book what sets this book apart are the numerous illustrations and diagrams that visually elucidate complex topics ensuring a clear and thorough understanding to reinforce learning the text includes problem and solution sets giving readers an opportunity to apply the concepts they have acquired this book is particularly valuable for college graduates and engineering students who are beginning their journey into the realm of electromagnetism it is also an excellent reference for practicing engineers seeking to refresh their knowledge of the basic principles of electromagnetism with a focus on both theory and practical application this volume provides a strong foundation for readers at various stages of their engineering education and career

an accessible introduction to the use of regression analysis in the social sciences regression with social data modeling continuous and limited response variables represents the most complete and fully integrated coverage of regression modeling currently available for graduate level behavioral science students and practitioners covering techniques that span the full spectrum of levels of measurement for both continuous and limited response variables and using examples taken from such disciplines as sociology psychology political science and public health the author succeeds in demystifying an academically rigorous subject and making it accessible to a wider audience content includes coverage of logit probit scobit truncated and censored regressions multiple regression with anova and ancova models binary and multinomial response models poisson negative binomial and other regression models for event count data survival analysis using multistate multiepisode and interval censored survival models concepts are reinforced throughout with numerous chapter problems exercises and real data sets step by step solutions plus an appendix of mathematical tutorials make even complex problems accessible to readers with only moderate math skills the book s logical flow wide applicability and uniquely comprehensive coverage make it both an ideal text for a variety of graduate course settings and a useful reference for practicing researchers in the field

suitable as a one semester course in general relativity for senior undergraduates or beginning graduates this text clarifies the mathematical aspects of einsteins general theory of relativity without sacrificing physical understanding beginning with an exposition of those aspects of tensor calculus and differential geometry needed for a proper exposition of the subject the discussion turns to the space time of general relativity and to geodesic motion comparisons and contrasts with newtons theory being drawn where appropriate a brief consideration of the field equations is followed by a discussion of physics in the vicinity of massive objects including an elementary treatment of black holes the book concludes with brief introductory chapters on gravitational radiation and cosmology and includes an appendix that reviews the special theory of relativity in preparing this new edition the authors have completely rewritten chapters to make the material readily accessible to physics students while many examples exercises and problems help guide the students through the theory

a student friendly guide to learning all the important ideas of elementary real analysis this resource is based on the author s many years of experience teaching the subject to typical undergraduate mathematics majors

Publishers' Trade List Annual, 1991 *1991-09*

elementary real analysis is a core course in nearly all mathematics departments throughout the world it enables students to develop a deep understanding of the key concepts of calculus from a mature perspective elements of real analysis is a student friendly guide to learning all the important ideas of elementary real analysis based on the author s many years of experience teaching the subject to typical undergraduate mathematics majors it avoids the compact style of professional mathematics writing in favor of a style that feels more comfortable to students encountering the subject for the first time it presents topics in ways that are most easily understood yet does not sacrifice rigor or coverage in using this book students discover that real analysis is completely deducible from the axioms of the real number system they learn the powerful techniques of limits of sequences as the primary entry to the concepts of analysis and see the ubiquitous role sequences play in virtually all later topics they become comfortable with topological ideas and see how these concepts help unify the subject students encounter many interesting examples including pathological ones that motivate the subject and help fix the concepts they develop a unified understanding of limits continuity differentiability riemann integrability and infinite series of numbers and functions

during the academic years 1972 1973 and 1973 1974 an intensive sem inar on the foundations of quantum mechanics met at stanford on a regular basis the extensive exploration of ideas in the seminar led to the org ization of a double issue of synthese concerned with the foundations of quantum mechanics especially with the role of logic and probability in quantum mechanics about half of the articles in the volume grew out of this seminar the remaining articles have been so licited explicitly from individuals who are actively working in the foun dations of quantum mechanics seventeen of the twenty one articles appeared in volume 29 of syn these four additional articles and a bibliography on the history and philosophy of quantum mechanics have been added to the present volume in particular the articles by bub demopoulos and lande as well as the second article by zanotti and myself appear for the first time in the present volume in preparing the articles for publication i am much indebted to mrs lillian o toole mrs dianne kanerva and mrs marguerite shaw for their extensive assistance
