the r language provides a rich environment for working with data especially data to be used for statistical modeling or graphics coupled with the large variety of easily available packages it allows access to both well established and experimental statistical techniques however techniques that might make sense in other languages are often very inefficient in r but due to r s flexibility it is often possible to implement these techniques in r generally the problem with such techniques is that they do not scale properly that is as the problem size grows the methods slow down at a rate that might be unexpected the goal of this book is to present a wide variety of data manipulation techniques implemented in r to take advantage of the way that r works rather than directly resembling methods used in other languages since this requires a basic notion of how r stores data the first chapter of the book is devoted to the fundamentals of data in r the material in this chapter is a prerequisite for understanding the ideas introduced in later chapters since one of the first tasks in any project involving data and r is getting the data into r in a way that it will be usable chapter 2 covers reading data from a variety of sources text files spreadsheets files from other programs etc as well as saving r objects both in native form and in formats that other programs will be able to work with
