a data structure is a storage that is used to store and organize data it is a way of arranging data on a computer so that it can be accessed and updated efficiently a data structure is not only used for organizing the data it is also used for processing retrieving and storing data there are different basic and advanced types of data in computer science a data structure is a data organization and storage format that is usually chosen for efficient access to data apply algorithmic techniques greedy algorithms binary search dynamic programming etc and data structures stacks queues trees graphs etc to solve 100 programming challenges that often appear at interviews at high tech companies get an instant feedback on whether your solution is correct apply the newly learned algorithms to solve open data structures covers the implementation and analysis of data structures for sequences lists queues priority queues unordered dictionaries ordered dictionaries and graphs data structures this chapter describes some things you ve learned about already in more detail and adds some new things as well 5 1 more on lists the list data type has some more methods here are all of the methods of list objects list append x add an item to the end of the list equivalent to a len a x list extend iterable these data types are the building blocks of data structures data types tell the interpreter or the computer how the programmer plans on using the data furthermore data analysts can choose from different data structure classifications the trick is to select the structure best suited for your needs and situation
