the quantum theory of macroscopic systems is a vast ever developing area of science that serves to relate the properties of complex physical objects to those of their constituent particles its essential challenge is that of finding the conceptual structures needed for the description of the various states of organization of many particle quantum systems in this book geoffrey sewell provides a new approach to the subject based on a macrostatistical mechanics which contrasts sharply with the standard microscopic treatments of many body problems sewell begins by presenting the operator algebraic framework for the theory he then undertakes a macrostatistical treatment of both equilibrium and nonequilibrium thermodynamics which yields a major new characterization of a complete set of thermodynamic variables and a nonlinear generalization of the onsager theory the remainder of the book focuses on ordered and chaotic structures that arise in some key areas of condensed matter physics this includes a general derivation of superconductive electrodynamics from the

assumptions of off diagonal long range order gauge covariance and thermodynamic stability which avoids the enormous complications of the microscopic treatments sewell also unveils a theoretical framework for phase transitions far from thermal equilibrium throughout the mathematics is kept clear without sacrificing rigor representing a coherent approach to the vast problem of the emergence of macroscopic phenomena from quantum mechanics this well written book is addressed to physicists mathematicians and other scientists interested in quantum theory statistical physics thermodynamics and general questions of order and chaos
