thank you for opening the second edition of this monograph which is devoted to the study of a class of nonsmooth dynamical systems of the general form  $\dot{x} = f(x, u, t)$  where  $x \in \mathbb{R}^n$  is the system s state vector  $u \in \mathbb{R}^m$  is the vector of inputs and the function  $f$  represents a unilateral constraint that is imposed on the state more precisely we shall restrict ourselves to a subclass of such systems namely mechanical systems subject to unilateral constraints on the position whose dynamical equations may be in a first instance written as  $\ddot{q} = f(q, \dot{q}, t)$  where  $q \in \mathbb{R}^n$  is the vector of generalized coordinates of the system and  $u$  is an in put or controller that generally involves a state feedback loop  $u = u(q, \dot{q}, t)$  with  $z = z(q, t)$  when the controller is a dynamic state feedback mechanical systems composed of rigid

bodies interacting fall into this subclass a general property of systems as in 0 1 and 0 2 is that their solutions are nonsmooth with respect to time nonsmoothness arises primarily from the occurrence of impacts or collisions or percussions in the dynamical behaviour when the trajectories attain the surface  $f(x, t) = 0$  they are necessary to keep the trajectories within the subspace  $x \in \mathbb{R}^n$  of the system's state space
