el crecimiento de las aplicaciones inalámbricas plantea nuevos desafíos a los futuros sistemas de comunicación como el uso ineficiente del espectro radioeléctrico las redes de radio cognitiva surgen como una solución a los problemas de escasez de espectro y uso ineficiente del recurso espectral mediante el acceso dinámico al espectro estas redes están caracterizadas por percibir aprender planificar toma de decisiones y actuar de acuerdo con las condiciones actuales de la red el objetivo general de una red de radio cognitiva consiste en que el usuario secundario acceda de manera oportuna a un canal de frecuencia disponible en una banda licenciada sin generar interferencia al usuario primario lo cual se puede lograr con una adecuada toma de decisión espectral la probabilidad de que dos o más usuarios secundarios elijan el mismo canal es alta especialmente cuando el número de usuarios secundarios es mayor que el número de canales disponibles y cuantos más usuarios secundarios seleccionen el mismo canal menor será la utilidad que cada uno pueda obtener y el número de interferencias por acceso simultáneo será mayor el desafío consiste entonces en dotar los nodos de una red descentralizada con la capacidad de aprender del entorno proponiendo estrategias que les permita a los usuarios secundarios tomar decisiones e intercambiar información de forma cooperativa o competitiva en un ambiente de acceso multiusuario al espectro asimismo este libro busca resolver la pregunta cómo y en qué medida se puede reducir la tasa de handoff espectral en redes de radio cognitiva descentralizadas con un enfoque multiusuario y colaborativo

in the andes mountainous region of south america grasslands known as páramos provide important ecosystem services like sustaining biodiversity securing carbon sequestration and providing water storage however many páramos regions are subject to land use change due to expanding agriculture intensified grazing and land burning these are usually caused by socio economic factors driving local communities to increase their income generation trying

to achieve a better understanding of the páramos is often restricted to exploring specific details and does not follow an integrated approach or a comprehensive ecosystem analysis in this research the focus is on better understanding the dominant ecohydrological processes and their interactions an integrated approach is followed using in situ measurements field experiments laboratory analyses and numerical modelling also different hydroinformatics tools are used to identify and quantify the ecosystem services provided by the páramos moreover a framework is developed that allows a more realistic quantification and mapping of the main ecosystem services the approach was carried out for a test site in an ecological area in north ecuador the findings show a clear difference in ecosystem services depending on their altitudinal range and type of vegetation these results can be used to further develop environmental management and landscape planning strategies in order to better meet the social goals this research is aligned with the priorities advocated in the ipcc report 2007 to improve representation of the interactive coupling between ecosystems and the climate system and with sdg 15 life on land by 2020 ensure the conservation restoration and sustainable use of terrestrial and inland freshwater ecosystems and their services
