the physiology of the semicircular canals was my main research interest before i began to study their morphology in 1966 by utilizing the isolated semicircular canal of the frog i was able to show that cell activity in the horizontal semicircular canal has the opposite polarity to that in the vertical canals which was the first physiological proof of ewald s law several transmitting electron microscope tem studies had already reported on the morphology of the semicircular canal cristae however my morphological work was motivated by a strong desire to see whether the morphological polarity accorded to the physio logical polarity in 1968 i happened to see the paper written by dr david lim one of my close friends his findings concerning the vestibular morphology when examined by scanning electron microscopy sem fascinated me a great deal because of the three dimensional quality of the micro graphs this stimulated me to become involved in vestibular morphol ogy in the beginning however i faced many problems with specimen preparation for sem and the first few years were spent simply solving technical problems especially those of artifacts many of the figures in this book have been photographed with a jeol jsm u 3 scanning electron microscope over a decade the sharpness of these pictures still i think bears comparison to the defi nition of those taken by the more sophisticated sem scopes currently available
