this book is devoted to the problems of construction and application of chi squared goodness of fit tests for complete and censored data classical chi squared tests assume that unknown distribution parameters are estimated using grouped data but in practice this assumption is often forgotten in this book we consider modified chi squared tests which do not suffer from such a drawback the authors provide examples of chi squared tests for various distributions widely used in practice and also consider chi squared tests for the parametric proportional hazards model and accelerated failure time model which are widely used in reliability and survival analysis particular attention is paid to the choice of grouping intervals and simulations this book covers recent innovations in the field as well as important results previously only published in russian chi squared tests are compared with other goodness of fit tests such as the cramer von mises smirnov anderson darling and zhang tests in terms of power when testing close competing hypotheses

with increased emphasis on helping readers understand the context in which power calculations are done this second edition of how many subjects by helena chmura

kraemer and christine blasey introduces a simple technique of statistical power analysis that allows researchers to compute approximate sample sizes and power for a wide range of research designs because the same technique is used with only slight modifications for different statistical tests researchers can then easily compare the sample sizes required by different designs and tests to make cost effective decisions in planning a study these comparisons demonstrate important principles of design measurement and analysis that are rarely discussed in courses or textbooks making this book a valuable instructional resource as well as a must have guide for frequent reference
