Airframe Maintenance and Repair 1976

a computer program has been developed for predicting twin nozzle aftbody drag and internal nozzle performance for fighter type aircraft having twin buried engines and dual nozzles the program is capable of generating the installed thrust minus drag data required for conducting mission analysis studies of aircraft of this type the configuration variables which can be analyzed include 1 nozzle type convergent flap and iris convergent divergent with and without secondary flow and shrouded and unshrouded plug 2 nozzle lateral spacing 3 interfairing type horizontal and vertical wedge 4 interfairing length and 5 vertical stabilizer type single and twin the performance

prediction methods incorporated in the program are based almost entirely on empirical correlations specifically correlations used in conjunction with one dimensional flow relationships are employed for the prediction of the nozzle thrust and discharge coefficients and correlations of the test data obtained during the contracted effort are employed for prediction of the aft end drag the prediction methods account for the effects of nozzle pressure ratio and flow separation on both internal and external nozzle surfaces this manual describes the operation of the computer program in terms of program input requirements performance prediction methods and output format and includes a presentation of sample input output cases and a complete computer listing of the program the program has been developed for use on the cdc 6600 computer

70+ EH-1 UH-1 Huey Helicopter Technical Manuals, Technical Bulletins, Modification Work Orders & Depot Maintenance Work Requirements Manuals 1972

small unmanned fixed wing aircraft design is the essential guide to designing building and testing fixed wing uavs or drones it deals with aircraft from two to 150 kg in weight and is based on the first hand experiences of the world renowned uav team at the uk s university of southampton the book covers both the practical aspects of designing manufacturing and flight testing and outlines and the

essential calculations needed to underpin successful designs it describes the entire process of uav design from requirements definition to configuration layout and sizing through preliminary design and analysis using simple panel codes and spreadsheets to full cfd and fea models and on to detailed design with parametric cad tools its focus is on modest cost approaches that draw heavily on the latest digital design and manufacturing methods including a strong emphasis on utilizing off the shelf components low cost analysis automated geometry modelling and 3d printing it deliberately avoids a deep theoretical coverage of aerodynamics or structural mechanics rather it provides a design team with sufficient insights and guidance to get the essentials undertaken more pragmatically the book contains many all colour illustrations of the dozens of aircraft built by the authors and their students over the last ten years giving much detailed information on what works best it is predominantly aimed at under graduate and msc level student design and build projects but will be of interest to anyone engaged in the practical problems of getting quite complex unmanned aircraft flying it should also appeal to the more sophisticated aero modeller and those engaged on research based around fixed wing uavs
