vi of oregon lectures in 1962 bass gave simplified proofs of a number of morita theorems incorporating ideas of chase and schanuel one of the morita theorems characterizes when there is an equivalence of categories  $\text{mod } a$   $\text{mod } b$  for two rings  $a$  and  $b$  morita's solution organizes ideas so efficiently that the classical wedderburn artin theorem is a simple consequence and moreover a similarity class  $aj$  in the brauer group  $\text{Br } k$  of azumaya algebras over a commutative ring  $k$  consists of all algebras  $b$  such that the corresponding categories  $\text{mod } a$  and  $\text{mod } b$  consisting of  $k$  linear morphisms are equivalent by a  $k$  linear functor for fields  $\text{Br } k$  consists of similarity classes of simple central algebras and for arbitrary commutative  $k$  this is subsumed under the azumaya 51 1 and auslander goldman 60j brauer group numerous other instances of a wedding of ring theory and category albeit a shot gun wedding are contained in the text furthermore in my attempt to further simplify proofs notably to eliminate the need for tensor products in bass's exposition i uncovered a vein of ideas

and new theorems lying wholly within ring theory this constitutes much of chapter 4 the morita theorem is theorem 4 29 and the basis for it is a correspondence theorem for projective modules theorem 4 7 suggested by the morita context as a by product this provides foundation for a rather complete theory of simple noetherian rings but more about this in the introduction
