this might be the first book that deals mostly with the 3d technology computer aided design tcad simulations of major state of the art stress and strain engineered advanced semiconductor devices mosfets bjts hbts nonclassical mos devices finfets silicon germanium hetero fets solar cells power devices and memory devices the book focuses on how to set up 3d tcad simulation tools from mask layout to process and device simulation including design for manufacturing dfm and from device modeling to spice parameter extraction the book also offers an innovative and new approach to teaching the fundamentals of semiconductor process and device design using advanced tcad simulations of various semiconductor structures the simulation examples chosen are from the most popular devices in use today and provide useful technology and device physics insights to extend the role of tcad in today s advanced technology era process compact modeling and dfm issues have been included for design technology interface generation unique in approach this book provides an integrated view of silicon technology and beyond with emphasis on tcad simulations it is the first book to provide a web based online laboratory for semiconductor device characterization and spice parameter extraction it describes not only the manufacturing practice associated with the technologies used but also the underlying scientific basis for those technologies written from an engineering standpoint this book provides the process design and simulation background needed to understand new and

future technology development process modeling and design of nanoscale transistors the book also advances the understanding and knowledge of modern ic design via tcad improves the quality in micro and nanoelectronics r d and supports the training of semiconductor specialists it is intended as a textbook or reference for graduate students in the field of semiconductor fabrication and as a reference for engineers involved in vlsi technology development who have to solve device and process problems cad specialists will also find this book useful since it discusses the organization of the simulation system in addition to presenting many case studies where the user applies tcad tools in different situations

there are many sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment there is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow the determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread the main objectives of this work are to develop an appropriate measurement methodology and a 3d cfd transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment this work is also aimed at comparing the numerical simulation results of different cfd programs for a 2d base case model of indoor air flow with and without emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the

selection of the suitable and appropriate cfd program for the further development of the simulation model one of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts

this book addresses issues concerning the engineering of system prod ucts that make use of computing technology these systems may be prod ucts in their own right for example a computer or they may be the computerised control systems inside larger products such as factory automation systems transportation systems and vehicles and personal appliances such as portable telephones in using the term engineering the authors have in mind a development process that operates in an integrated sequence of steps employing defined techniques that have some scientific basis furthermore we expect the operation of the stages to be subject to controls and standards that result in a product fit for its intended purpose both in the hands of its users and as a business venture thus the process must take account of a wide range of requirements relating to function cost size reliabili ty and so on it is more difficult to define the meaning of computing technology these days this involves much more than computers and software for example many tasks that might be performed by software running in a general purpose computer can also be performed directly by the basic technology used to construct a computer namely digital hardware however hardware need not always be digital we live in an analogue world hence analogue signals appear on the boundaries of our systems and it can sometimes be advantageous to allow them to penetrate further
