 describes the formation of new blood vessels which arise as outgrowths from existing
 vessels in many physiological processes such as ovulation and wound healing
 angiogenesis is involved for a relatively short time otherwise under normal
 physiological conditions in the adult organism angiogenesis is an extremely slow
 process by contrast in certain disease states such as diabetic retinopathy arthritis
 chronic inflammation hemangiomas etc angiogenesis persists and contributes to the
 pathology of these disease states some 50 such angiogenic diseases have been
 described where angiogenesis is involved also in tumor growth and metastasis
 angiogenesis is an essential process and precedes neoplastic transformation hence
 angiogenesis could become an important diagnostic tool and a target for developing
 therapeutic agents this book contains the proceedings of the nato advanced study
 institute on angiogenesis in health and disease held in porto hydra greece from june
 16 27 1991 this meeting was a comprehensive review of endothelial cell biology and
 endothelial cell phenotypic and functional heterogeneity in relation to angiogenesis
 under physiological and pathological conditions numerous in vitro and in vivo models
 were presented which are used to study angiogenesis at the molecular and cellular
 levels and to evaluate chemical compounds or naturally occurring substances for their
 effect on angiogenesis the presentations and discussions at this meeting provided an
 opportunity for the basic science and the clinical disciplines to meet exchange
 information and provide future research directions for many investigators engaged in
 the study of angiogenesis angiogenesis is a multistep process which involves
 activation proliferation and directed migration of endothelial cells to form new
 capillaries from existing vessels under physiological conditions in the adult
 organisms angiogenesis is extremely slow yet it can be activated for a limited time
 only in situations such as ovulation or wound healing in a number of disease states
 however there is a derangement of angiogenesis which can contribute to the pathology
 of these conditions hence understanding the molecular biology of endothelial cell
 activation and differentiation and the mechanisms involved in the regulation of
 angiogenesis could explain the derangement in disease states and also provide the
 basis for developing promoters or suppressors of angiogenesis for clinical
 applications this book contains the proceedings of the nato advanced study institute
 on angiogenesis molecular biology clinical aspects held in rhodes greece from june 16
 27 1993 this meeting was a comprehensive review of the various aspects of
 angiogenesis such as embryonic development endothelial cell heterogeneity and tissue
 specificity molecular biology of endothelial cell mechanisms for the regulation of
 angiogenesis disease states in which angiogenesis is involved and potential
 application of promoters or suppressors of angiogenesis the presentations and
 discussions of the meeting provided an opportunity for investigators from many
 different areas of basic science and medicine to exchange information evaluate the
