A Little Book on the Custom OS Development from Scratch 2019-02-17 this ibm redbooks publication is intended to make system programmers operators and availability managers aware of the enhancements to recent releases of ibm z os and its major subsystems in the area of planned outage avoidance it is a follow on to rather than a replacement for z os planned outage avoidance checklist sg24 7328 its primary objective is to bring together in one place information that is already available but widely dispersed it also presents a different perspective on planned outage avoidance most businesses care about application availability rather than the availability of a specific system also a planned outage is not necessarily a bad thing if it does not affect application availability in fact running for too long without an ipl or subsystem restart might have a negative impact on application availability because it impacts your ability to apply preventive service therefore this book places more focus on decoupling the ability to make changes and updates to your system from ipling or restarting your systems
