the development of international trade theory has created a wide array of different theories concepts and results nevertheless trade theory has been split between partial and conflicting representations of international economic interactions diverse trade models have co existed but not in a structured relationship with each other economic students are introduced to international economic interactions with severally incompatible theories in the same course in order to overcome incoherence among multiple theories we need a general theoretical framework in a unified manner to draw together all of the disparate branches of trade theory into a single ganized system of knowledge this book provides a powerful but easy to operate engine of analysis that sheds light not only on trade theory per se but on many other dim sions that interact with trade including inequality saving propensities education research policy and knowledge building and analyzing various tractable and flexible models within a compact whole the book helps the reader to visualize

economic life as an endless succession of physical capital accumulation human capital accumulation innovation wrought by competition monopoly and government intervention the book starts with the traditional static trade theories then it develops dynamic models with capital and knowledge under perfect competition and or monopolistic competition the uniqueness of the book is about modeling trade dynamics

lecture notes in international trade theory covers classical international trade models including the ricardian ricardo viner and heckscher ohlin samuelson models the course is designed for m sc and first year phd students it relies on both graphical and analytic methods requiring only intermediate microeconomics and a solid grounding in calculus the material emphasizes second best settings where markets are imperfect the goal is to equip students with a good enough understanding of open economy general equilibrium relations that they understand how distortions ripple across different markets e g commodity and factor markets the author applies these ideas to environmental and natural resource problems including pollution leakage where pollution reductions in one country are offset by trading partners increased pollution and imperfect property rights other applications include the general equilibrium effects of commodity and trade taxes international transfers the transfer problem minimum wage constraints and immiserizing growth the author assumes that students have some experience in formulating and answering comparative statics questions in an optimization setting building on these skills and developing the idea of stability in an equilibrium setting the marshall lerner condition students learn how to formulate and answer comparative static questions in trade models

inframarginal analysis represents a methodology that extends marginal analysis using non classical mathematical programming in efforts to investigate corner solutions and indivisibilities as such this approach has been used to reintroduce classical insights regarding the division of labor and economic organization to the mainstream of economic inquiry one of the most prolific and useful relevant applications of inframarginal analysis concerns the area of international trade theory the ensuing field of study has attracted considerable and rapidly expanding interest in recent years yet little has been done by way of organizing the accumulated knowledge in a single volume this book fills that gap by collecting key articles that mark distinct stages in the evolution of research in the area of

inframarginal applications to trade theory in this context the volume represents an excellent introduction of this novel and exciting field of study to the new researcher and an invaluable source of reference to those seasoned in inframarginal applications to trade theory

there has long been a need for a systematic introduction to the modern pure theory of international trade that would take the student through a careful introduction to the tools of analysis and the main logical propositions into the application of the theory to practical problems of international economic policy trade theory should be part and parcel of price theory distinguished only by the fact that other countries form part of the natural opportunities and natural constraints that a country confronts in its efforts to bend nature to its desire to produce utility yielding goods and services but its exposition is often confused by the attachment of its expositors to obsolete problems and backward analytical techniques this book covers in detail classical neoclassical and modern theories of international trade with special attention to problems of equilibrium growth and welfare and discusses the work of all major contributors in this field from ricardo and mill through meade heckscher and ohlin to the growth models of johnson solow and uzawa all problems are clearly stated and the easiest and most convenient solutions are sought in each case with the more technical topics in the field discussed in several chapters and appendixes that may be omitted for less advanced students without interrupting the continuity of the book the book s coverage is complete

and entirely up to date it is written primarily for advanced undergraduate and graduate courses in international trade but it will also serve as an important reference tool for professional economists working in this field and will be of considerable interest to students and practitioners dealing with problems of economic development and international business relationships more generally

International Trade; Theory and Empirical Evidence 1973

this volume is a collection of the author s past and recent research it concentrates on some topics that continue to be neglected in mainstream trade theory but which have grown in empirical relevance as the decades have passed and allow us to broaden our world view these include adding multinational firms and a major role for the demand side of general equilibrium to our conventional portfolio of models part i in the volume focuses on multinational firms and the incorporation of endogenous location and

ownership choices into general equilibrium trade models a particular emphasis repeatedly confirmed in empirical studies is on horizontal firms that replicate activities across borders two chapters on the vertical integration versus outsourcing decision reveal the non excludable property of knowledge based assets part ii focuses on the demand side of general equilibrium arguing and showing empirically that non homothetic preferences which give an important role to per capita income help explain many of the empirical puzzles that trade economists keep trying to explain only from the production side of general equilibrium part iii is eclectic but the chapters in this section share the common thread of showing how distortions and allowing trade in factors of production both modify traditional policy ideas and also create additional sources of gains from trade
