dredges are designed to vacuum material from the sea floor through drag arms that load the material into the hold of the vessel the cargo of mud or sand
can then be transported to either an ocean disposal site where the material is dropped to the bottom through openings in the bottom of the hull or at an
upland site such as a beach or reclamation where the material is pumped ashore by the ship this method is most suited when excavating loose material
from open areas for delivery to a distant disposal location these vessels are generally certified to sail in coastal or ocean waters and are suited for working
in rougher sea conditions beyond those suitable for other dredging plants the results indicate it to be conservative design in the elastic range to neglect the
effect of lateral pressure on the sheet buckling load and on the load carried by the sheet after buckling solve energy problems quickly and accurately filled

industrial food processing involves the production of added value foods on a large scale these foods are made by mixing and processing different ingredients in a prescribed way the food industry historically has not designed its processes in an engineering sense i e by understanding the physical and chemical principles which govern the operation of the plant and then using those principles to develop a process rather processes have been designed by purchasing equipment from a range of suppliers and then connecting that equipment together to form a complete process when the process being run has essentially been scaled up from the kitchen then this may not matter however there are limits to the approach as the industry becomes more sophisticated and economies of scale are exploited then the size of plant reaches a scale where systematic design techniques are needed the range of processes and products made by the food industry has increased to include foods which have no kitchen counterpart such as low fat spreads it is vital to ensure the quality and safety of the product plant must be flexible and able to cope with the need to make a variety of products from a range of ingredients this is especially important as markets evolve with time the traditional design process cannot readily handle multi product and multi stream operations processes must be energetically efficient and meet modern environmen tal standards
